At the Stanford Linear Accelerator Center (SLAC), the authors are designing a Next Linear Collider (NLC) with linacs powered by X-band klystrons with rf pulse compression. The design of the linac rf system is based on X-band prototypes which have been tested at high power, and on a systems-integration test - the Next Linear Collider Test Accelerator (NLCTA) - which is currently under construction at SLAC. This paper discusses some of the systems implications of rf pulse compression, and the use of pulse compression in the NLCTA, both for peak power multiplication and for controlling, by rf phase modulation, intra-pulse variations in the linac beam energy.

10667 (SLAC-PUB–6543) **A history of thyratron lifetimes at the Stanford Linear Accelerator Center.** Ficklin, D.B. Jr. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-940678–10: 21. international power modulator symposium, Costa Mesa, CA (United States), 28-30 Jun 1994). Order Number DE95006216. Source: OSTI; NTIS; INIS; GPO Dep.

The Stanford Linear Accelerator Center (SLAC) has been in almost continuous operation since the middle 1960s, providing a remarkable opportunity to amass thyratron data. This paper reviews the history of this thyratron usage, focusing primarily on data collected during the last ten years of accelerator operation. There have been two distinct operating conditions during the history of operation at SLAC. Prior to 1985, the fundamental thyratron operating points were 46 kV anode voltage (Epy), 4.2 kA peak current, 3.8 μs equivalent square pulse (esp), with a maximum repetition rate of 360 pulses per second (pps). The accelerator was upgraded during 1985, and the thyratron operating points are now 46 kV Epy, 6.3 kA, 5.4 μs esp, with a maximum repetition rate of 120 pps. The SLAC high-energy physics research program requires that each of the available modulator klystron units provide a stable microwave energy source. Within these constraints, this paper explores historical thyratron lifetimes at SLAC, reviewing the available data to determine how long these thyratrons can be expected to operate before failure currently or recently used in the 243 accelerator modulators.

10668 (SLAC-PUB–6632) **Faster magnet sorting with a threshold acceptance algorithm.** Lidia, S. (Univ. of California, Davis, CA (United States). Dept. of Physics); Carr, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (SLAC/SSRL–0091; CONF-940714–48: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95006487. Source: OSTI; NTIS; INIS; GPO Dep.

The authors introduce here a new technique for sorting magnets to minimize the field errors in permanent magnet insertion devices. Simulated annealing has been used in this role, but they find the technique of threshold acceptance produces results of equal quality in less computer time. Threshold accepting would be of special value in designing very long insertion devices, such as long FEL's. Their application of threshold acceptance to magnet sorting showed that it converged to equivalently low values of the cost function, but that it converged significantly faster. They present typical cases showing time to convergence for various error tolerances, magnet numbers, and temperature schedules.

10669 (SSCL-Preprint–564) **Beam tube vacuum in future superconducting proton colliders.** Turner, W. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95008041. Source: OSTI; INIS; NTIS; GPO Dep.

The beam tube vacuum requirements in future superconducting proton colliders that have been proposed or discussed in the literature – SSC, LHC, and ELN – are reviewed. The main beam tube vacuum problem encountered in these machines is how to deal with the magnitude of gas desorption and power deposition by synchrotron radiation while satisfying resistivity, impedance, and space constraints in the cryogenic environment of superconducting magnets. A beam tube vacuum model is developed that treats photodesorption of tightly bound H, C, and O, photodesorption of physisorbed molecules, and the isotherm vapor pressure of H_2. Experimental data on cold tube photodesorption experiments are reviewed and applied to model calculations of beam tube vacuum

performance for simple cold beam tube and liner configurations. Particular emphasis is placed on the modeling and interpretation of beam tube photodesorpiion experiments at electron synchrotron light sources. The paper also includes discussion of the constraints imposed by beam image current heating, the growth rate of the resistive wall instability, and single-bunch instability impedance limits.

10670 (SSCL-Preprint–571) **The SSC full cell prototype string test.** Kraushaar, P.; Burgett, W.; Cromer, L. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95008040. Source: OSTI; NTIS; INIS; GPO Dep.

At the conclusion of the SSC half cell magnet string testing program. In February, 1993, the preliminary data analysis revealed that several substantive technical questions remained unresolved. These questions were: (1) could the high voltages to ground (>2 kV) measured during fault (quench) conditions be substantially reduced, (2) could the number of magnetic elements that became resistive (quenched) be controlled and (3) did the cryostats of the magnetic elements provide adequate insulation and isolation to meet designed refrigeration loads. To address these and other existing question a prototypical full cell of collider magnets (ten dipoles and two quadrupoles) was assembled and tested. At the conclusion of this testing there were definitive answers to most of the questions with numerical substantiation, the notable exception being the beat leak question. These answers and other results and issues are presented in this paper.

4304 Storage Rings

10671 (DESY–94-171) **The first achievement of longitudinal spin polarization in a high energy electron storage ring.** Barber, D.P. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Boege, M.; Bremer, H.D.; Brinkmann, R.; Brueckner, W.; Dueren, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 13p. Order Number DE95756108. Source: OSTI; NTIS (US Sales Only); INIS.

A pair of spin rotators has been installed in the electron ring of HERA. Longitudinal spin polarizations up to 65% have been reached reproducibly during dedicated measurement time. This is the first time that longitudinal spin polarization has been produced in a high energy electron storage ring. (orig.)

10672 (ENEA-RT-INN–94-25) **Model for saturation of storage ring free electron laser.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Giannessi, L.; Renieri, A.; Ottaviani, P.L. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jun 1994. 16p. (RT/INN–94-25). Order Number DE95749666. Source: OSTI; NTIS (US Sales Only).

The dynamical properties of a storage ring free electron laser Oscillator are reproduced using a model combining three different saturation mechanisms: laser induced energy spread of the e-beam, associated bunch lengthening and longitudinal synchronism between laser and electron pulses. The stationary output power is shown to be always linked on the power emitted via synchrotron radiation in one machine turn by the circulating e-beam.

10673 (INIS-mf–15084) **Berliner Elektronenspeicherring-Gesellschaft fuer Synchrotronstrahlung (BESSY). Annual report 1993.** Gaupp, A. (comp.); Jung, C. (comp.). Berliner Elektronenspeicherring-Gesellschaft fuer Synchrotronstrahlung mbH (BESSY), Berlin (Germany). 1994. 607p. (In German). Order Number DE95746205. Source: OSTI; NTIS (US Sales Only); INIS.

The first part of the report presents general information on the organisational structure of the BESSY institution and explains the experimental devices and user activities at the BESSY I department, followed by an overview of achievements and developments relating to machines and experiments, including the BESSY II project. The main reporting part summarizes the activities and achievements of the Lithography Laboratory of the Fraunhofer Institute for Silicon Technology, (ISIT) and of the Radiometry Laboratory of PTB, and the basic research activities, arranged according to subject areas. The machine developments are reported, placing emphasis on the developments in the BESSY II project. There is a list of events held at BESSY and of visitors, followed by a bibliography of publications and theses based on research work carried out at BESSY. (orig./HP)

10674 (JINR–6-63-93, pp. 45-54) **Acceleration of deuterons at the UNK. Proposal.** Vasil'ev, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation)); Vorozhtsov, S.B.; Dmitrievskij, V.P.; Myaeh, Eh.A.; Teplyakov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1993. In *JINR rapid communications. Collection 6.* 62p. Order Number DE95616386. Source: OSTI; NTIS (US Sales Only); INIS.

In this article possible perspectives of using UNK for accelerating multicharged ions with minimal additions and changes in systems of complex UNK are considered. Deuteron accelerating is proposed as the minimum variant in which one supposes to reach energy till 1.5 TeV/nucleon in one beam. (author). 13 refs., 1 tab.

10675 (KEK-PROC–93-10, pp. 363-366) **Test apparatus of electron/positron conversion system for SPring-8 Linac.** Mizuno, Akihiko (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Suzuki, Shinsuke; Yoshikawa, Hiroshi; Hori, Toshihiko; Yanagida, Kenichi; Tamezane, Kenji; Yokomizo, Hideaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

For designing an electron/positron convertor for SPring-8 Linac, a test apparatus of the convertor was installed in a beam line of JAERI-Linac at Tokai establishment, JAERI. Last year, we reported results of simulation for the test apparatus. In this session, we report experimental results of the test apparatus. In this experiment, effects of test apparatus elements, such as pulse-solenoidal coil, DC1 coil, DC2 coil and accelerator structure are observed. These effects are qualitatively coincident with expectation causing from simulation results. A best conversion efficiency in these experiments was obtained as 0.27% at the end of the test apparatus. (author).

10676 (BNL–61315) **Performance of an accordion electromagnetic calorimeter with liquid krypton.** Lissuaer, D. Brookhaven National Lab., Upton, NY (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9409268–4: 5. international conference on calorimetry in high energy physics, Upton, NY (United States), 25 Sep - 1 oct 1994). Order Number DE95006693. Source: OSTI; NTIS; INIS; GPO Dep.

Beam test results of the liquid krypton electromagnetic calorimeter with a projective accordion type electrode structure are presented. The electrode had a fine segmentation in the front to enhance π^0 rejection and pointing. The test was carried out at the H4 line at the CERN SPS with e^- beams between 20 and 200 GeV. Preliminary results of energy resolution, linearity, μ response and the dependence of the energy resolution on the amount of inactive material in front of the calorimeter are presented.

10677 (BNL–61316) **Precision electromagnetic calorimetry with liquid krypton.** Takai, H. Brookhaven National Lab., Upton,

NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941060–3: 4. international conference on advanced technology and particle physics, Como (Italy), 3-7 Oct 1994). Order Number DE95006685. Source: OSTI; NTIS; INIS; GPO Dep.

Test beam results of a liquid krypton electromagnetic calorimeter with projective accordion electrode are presented. The electrode design includes a fine segmentation section to enhance the π^0 rejection and pointing. The test was carried out at the H4 beam line at the CERN SPS with electron beams of energy from 20 to 200 GeV. Preliminary results of energy resolution, linearity, μ response are presented. The author also presents the dependence of the energy resolution on the amount of inactive material in front of the calorimeter.

10678 (BNL–61328) **Low noise monolithic SI JFETs for operation in the 90-300K Range and in high radiation environments.** Radeka, V. (Brookhaven National Lab., Upton, NY (United States)); Citterio, M.; Rescia, S.; Manfredi, P.F.; Speziali, V. Brookhaven National Lab., Upton, NY (United States). Dec 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9505163–1: Low temperature electronics and high temperature superconductivity conference, Reno, NV (United States), 21-26 May 1995). Order Number DE95007303. Source: OSTI; NTIS; INIS; GPO Dep.

Development of low noise preamplifters for large ionization chambers with liquid argon (LAr) and liquid krypton (LKr) used in high energy physics experiments for measurement of energy of charged particles and photons requires die choice of a technology able to withstand the environment: a temperature of 90 K -120 K; an ionizing radiation dose of 1-2 Mrad; a neutron fluence of 0.5 - 1.10^{14}n/cm^2. Silicon JFETs by virtue of their reliable noise behavior and their intrinsic radiation hardness appear to be very suitable devices for applications both at room and cryogenic temperatures. We describe the noise properties of JFET devices and a monolithic preamplifier suitable for amplification of charge and current signals.

10679 (CONF-940514–19) **Monolithic electronics for nuclear and high-energy physics experiments.** Young, G.R. Oak Ridge National Lab., TN (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Intersections of particle and nuclear physics; St. Petersburg, FL (United States); 31 May - 6 jun 1994. Order Number DE95005393. Source: OSTI; INIS; NTIS; GPO Dep.

Electronic instrumentation for large fixed-target and collider experiments is rapidly moving to the use of highly integrated electronics wherever it is cost effective. This trend is aided by the development of circuit building blocks useful for nuclear and high-energy physics instrumentation and has accelerated recently with the development of monolithic silicon chips with multiple functions on one substrate. Examples of recent developments are given, together with remarks on the rationale for use of monolithic electronics and economic considerations.

10680 (DESY–93-078) **The H1 liquid argon calorimeter system.** Andrieu, B.; Babayev, A.; Ban, J.; Banas, E.; Barrelet, E.; Bassler, U.; Bederede, D.; Bernard, R.; Bernardi, G.; Bernier, R.; Besancon, M.; Biasci, J.C.; Binder, E.; Blouzon, F.; Blume, H.; Borras, K.; Boudry, V.; Brasse, F.; Breton, D.; Brettel, H.; BrisH1 Calorimeter Group. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1993. 65p. Order Number DE95746705. Source: OSTI; NTIS (US Sales Only); INIS.

The liquid argon calorimeter of the H1 detector presently taking data at the HERA ep - collider at DESY, Hamburg, is described here. The main physics requirements and the most salient design features relevant to this calorimeter are given. The aim to have smooth and hermetic calorimetric coverage over the polar angular range $4 \leq \theta \leq 154$ is achieved by a single liquid argon cryostat containing calorimeter stacks structured in wheels and octants for easy handling. The absorber materials used are lead in the electromagnetic part and stainless steel in the hadronic part. The read-out system is pipelined to reduce the dead time induced by the high trigger rate expected at the HERA collider where consecutive bunches are separated in time by 96 ns. The main elements of the calorimeter, such as the cryostat, with its associated cryogenics, the stack modules, the read-out, calibration and trigger electronics as well as the data acquisition system are described. Performance results from data taken in calibration runs with full size H1 calorimeter stacks at a CERN test beam, as well as results from data collected with the complete H1 detector using cosmic rays during the initial phase of ep operations are presented. The observed energy resolutions and linearities are well in agreement with the requirements. (orig.)

10681 (DESY–94-73(prepr.)) **Intensity measurements of slowly extracted heavy Ion beams from the SIS.** Heeg, P.; Peters, A.; Strehl, P. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 8p. Order Number DE95745901. Source: OSTI; NTIS (US Sales Only); INIS.

The paper reports about performance tests of newly designed Secondary Electron Monitors (SEM), Ionization Chambers (IC) and Multi Diode Counters (MDC). Especially the linearity of the detectors with respect to the specific energy loss will be discussed. Calibration has been performed by means of scintillation particle counters at the lower end of the intensity region. The status of the Cryogenic Current Comparator (CCC), which is provided for absolute measurements and calibration of detectors above some nA of beam current is reported, too. (orig.)

10682 (DESY–94-183) **The ZEUS calorimeter first level trigger.** Smith, W.H. (Wisconsin Univ., Madison, WI (United States)); Ali, I.; Behrens, B.; Fordham, C.; Foudas, C.; Goussiou, A.; Jaworski, M.; Kinnel, T. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 37p. Order Number DE95756054. Source: OSTI; NTIS (US Sales Only); INIS.

The design of the ZEUS Calorimeter First Level Trigger (CFLT) is presented. The CFLT utilizes a pipelined architecture to provide trigger data for a global first leel trigger decision 5 μsec after each beam crossing, occurring every 96 nsec. The charges from 13K phototubes are summed into 1792 trigger tower pulseheights which are digitized by flash ADC's. The digital values are linearized, stored and used for sums and pattern tests. Summary data is forwarded to the Global First Level Trigger for each crossing 2 μsec after the crossing occurred. The CFLT determines the total energy, the total transverse energy, the missing energy, and the energy and number of isolated electrons and muons. It also provides information on the electromagnetic and hadronic energy deposited in various regions of the calorimeter. The CFLT has kept the experimental trigger rate below $\approx$200 Hz at the highest luminosity experienced at HERA. Performance studies suggest that the CFLT will keep the trigger rate below 1 kHZ against a rate of proton-beam gas interactions on the order of the 100 kHz expected at design luminosity. (orig.)

10683 (DESY–94-194) **Compensating calorimeters with inorganic active media for improved electron detection.** Tymieniecka, T. (Warsaw Univ. (Poland)). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 18p. Order Number DE95756046. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper er describe how compensating calorimeters can be modified to improve their resolution for electrons without degrading their energy resolution for hadrons. (orig.)

10684 (DOE/ER/40706–2) **Research in elementary particle physics. Technical progress report, June 1, 1993–May 31, 1994.** Bensinger, J.R.; Blocker, C.A.; Kirsch, L.E.; Schnitzer, H.J. Brandeis Univ., Waltham, MA (United States). Dept. of Physics. [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40706. Order Number DE95007323. Source: OSTI; NTIS; INIS; GPO Dep.

The Brandeis experimental particle physics group has for many years pursued an understanding of physical interactions at the highest available energies. To this end they have been active in the development of the Collider Detector at Fermilab (CDF) and in the development of detectors that were planned for the SSC. They have also had an active program of analysis to understand the data and its implications from these detectors. Brandeis remains fully engaged in the understanding of physical interactions at the highest available energies. While pursuing physics analysis, detector support activities and detector upgrades at CDF, they are also exploring the physics potential of the LHC. Pending overall agreements between the Department of Energy and CERN, the authors

have joined the ATLAS experiment at CERN. The expertise gained in planning SSC detectors is directly applicable there. During the past year, the theoretical physics group pursued research in quantum field theory, with the 1/N expansion and other non-perturbative methods providing a unifying theme of much of this work. Activities centered on large N limit in scalar field theories, and two-dimensional Yang-Mills theories.

10685 (EGG-NRE–11457) **SWEPP gamma-ray spectrometer system software test plan and report.** Femec, D.A. Idaho National Engineering Lab., Idaho Falls, ID (United States). Sep 1994. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95005044. Source: OSTI; NTIS; INIS; GPO Dep.

The SWEPP Gamma-Ray Spectrometer (SGRS) System has been developed by the Radiation Measurements and Development Unit of the Idaho National Engineering Laboratory to assist in the characterization of the radiological contents of contact-handled waste containers at the Stored Waste Examination Pilot Plant (SWEPP). In addition to determining the concentrations of gamma-ray-emitting radionuclides, the software also calculates attenuation-corrected isotopic mass ratios of specific interest, and provides controls for SGRS hardware as required. This document presents the test plan and report for the data acquisition and analysis software associated with the SGRS system.

10686 (FEI–2250) **Intermediate efficiency BGO-detector for time-of-flight capture cross-section measurements.** Kornilov, N.V.; Semenova, N.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 18p. Order Number DE95618928. Source: OSTI; NTIS (US Sales Only); INIS.

The possibilities of further improvements of the intermediate-efficiency detector for capture cross-section measurements based on the BGO scintillator are discussed. The good agreement between the experimental and theoretical time distribution indicates that the theoretical limit of the time resolution is achieved. The conclusion is made that BGO-detector allows for a time resolution <2 ns if the number of photoelectrons exceeds 500. 15 refs.; 5 figs.; 1 tab.

10687 (FNAL/C–94/391-E) **SVX II a silicon vertex detector for run II of the tevatron.** Bortoletto, D. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 17p. Sponsored by USDOE, Washington, DC (United States);Sloan (Alfred P.) Foundation, New York, NY (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9405257–1: 3. international workshop on vertex detectors, Bloomington, IN (United States), May 1994). Order Number DE95006682. Source: OSTI; NTIS; INIS; GPO Dep.

A microstrip silicon detector SVX II has been proposed for the upgrade of the vertex detector of the CDF experiment to be installed for run II of the Tevatron in 1998. Three barrels of four layers of double sided detectors will cover the interaction region. The requirement of the silicon tracker and the specification of the sensors are discussed together with the proposed R&D to verify the performance of the prototypes detectors produced by Sintef, Micron and Hamamatsu.

10688 (FNAL/C–95/003-E) **The CDF upgrade.** Newman-Holmes, C. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Istituto Nazionale di Fisica Nucleare, Rome (Italy);Ministry of Education, Science and Culture (Japan);National Science Council, Taipei (Taiwan, DOE Contract AC02-76CH03000. (CONF-941060–2: 4. international conference on advanced technology and particle physics, Como (Italy), 3-7 Oct 1994). Order Number DE95006683. Source: OSTI; NTIS; INIS; GPO Dep.

The Collider Detector at Fermilab (CDF) has been used to study proton-antiproton collisions at the Fermilab Tevatron since 1985. Over the years, the detector has evolved steadily to increase its physics capability and to keep pace with improvements to the Tevatron. Fermilab is currently building a new Main Injector accelerator which will lead to even larger luminosity values. This paper describes upgrades to CDF that will allow one to exploit the higher luminosity of the Main Injector.

10689 (FNAL/C–95/012-E) **Cosmic ray test results of the DO prototype scintillating fiber tracker.** Adams, D. (Rice Univ., Houston, TX (United States)); Bertram, I.; Adams, M.; Chung, M.; Baumbaugh, B.; Bross, A.; Casey, D.; Cretsinger, C.; Chang, S.; Cooper, C. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941060–4: 4. international conference on advanced technology and particle physics, Como (Italy), 3-7 Oct 1994). Order Number DE95007215. Source: OSTI; NTIS; INIS; GPO Dep.

The performance of a large scale scintillating fiber tracker with VLPC readout has been studied in a cosmic-ray test. Approximately 9.6 photoelectrons per single layer per trigger were detected at a VLPC bias voltage of 6.5V. The doublet efficiency was nearly 100% at a 0.1% noise level and a position resolution of about 140μm was measured. The authors also studied the relationship between VLPC performance and VLPC bias voltage by measuring single fiber efficiency as a function of VLPC bias in the range 6.2V to 7.0V at a fixed temperature of 6.5°K. They observed no significant variation in VLPC performance within this bias range.

10690 (GSI–94-12) **X-ray spectroscopy of highly-charged ions in a storage ring. Invited lecture.** Beyer, H.F. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 64p. (CONF-9407166–: NATO Advanced Study Institute: physics with multiply charged ions, Cargese (France), 18-30 Jul 1994). Order Number DE95745816. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the present lectures is to carry through the methods and procedures necessary for a meaningful spectroscopy of the heaviest few-electron ions in relation to present theories. Results achieved so far in accelerator-based X-ray experiments are highlighted with emphasis on recent developments on heavy-ion storage rings. Starting with a brief account of the basics of one-electron ions, the motivation for doing X-ray spectroscopy of the simplest atomic systems with a high nuclear charge is given. In section 2 X-ray instrumentation and techniques are discussed including the precautions necessary when dealing with fast-beam sources. Peculiarities of heavy-ion storage rings are investigated in section 3 with regard to their use for spectroscopy. In section 4 are discussed results obtained so far on the measurement of the Lamb shift in very heavy ions. Section 5 gives some perspectives for the near future. (orig.)

10691 (GSI–94-63(prepr.)) **Cold-target recoil-ion momentum-spectroscopy: First results and future perspectives of a novel high resolution technique for the investigation of collision induced many-particle reactions.** Ullrich, J. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Doerner, R.; Mergel, V.; Jagutzki, O.; Spielberger, L.; Schmidt-Boecking, H. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Sep 1994. 20p. Order Number DE95746169. Source: OSTI; NTIS (US Sales Only); INIS.

In order to investigate many-particle reaction dynamics in atomic collisions a novel high-resolution technique has been developed, which determines the momentum and the charge state of the slowly recoiling target ions. Using a very cold, thin, and localized supersonic gas jet target a momentum resolution of better than 0.05 a.u. is obtained by measuring the recoil-ion time-of-flight and the recoil-ion trajectory. Because of the very high detection efficiency of nearly 100% this technique is well suited for many-particle coincidence measurements in ionizing collisions. First experimental results for fast ion and electron impact on helium targets are presented. Future applications in atomic collision physics and related areas are discussed. (orig.)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 7p. (IFVE–92-86.). Order Number DE95618939. Source: OSTI; NTIS (US Sales Only); INIS.

Method of light collection from lengthy scintillation plates through optical fiber with reemitter, which enables improving spatial resolution by hadron registration, is described. Nonuniformity of light collection of scintillators 20 x 20 x 0.4 cm in size was studied. Two optical fibers 1.2 mm in diameter and 20 cm long were connected to the scintillator narrow angle. The photoflux dependence on the distance between the radiation source and the scintillator was measured for each optical fiber. The light collection efficiency on the scintillator angular configuration was also measured. 4 refs., 6 figs.

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 10p. (IFVE-OEF–92-104.). Order Number DE95620428. Source: OSTI; NTIS (US Sales Only); INIS.

Structure of electromagnetic calorimeter and shower maximum detector is described. The electromagnetic calorimeter consists of four sections each of them containing 7 lead plates 4 mm thick alternating with scintillation plates 5 mm thick. Fiber-optical reemitter 1.3 mm in diameter joins the scintillation plates. The total length of the optical fiber in the section equals 2.5 m. The calorimeter energy resolution was measured on electron beams of 26 GeV and pion beams of 39 GeV. The calorimeter energy resolution is evaluated as equal to 18%/$\sqrt{E}$. The calorimeter is intented for RHIC experiments on the STAR facility. 7 refs., 10 figs.

(Thailand)); Singkarat, S.; Intarasiri, S.; Hoyes, G.; Vilaithong, T. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Absolute efficiency values for 5" diameter x 2" thick. BC-501 liquid scintillation detector at neutron energies ranging from 1 to 14 MeV were measured. Time-of-flight technique was employed to determine the energies of neutrons emitted from spontaneous fission of Cf-252 located inside a fission chamber. Time-of-flight spectra were acquired at neutron energy threshold of 1 MeV using the Multiparameter-Buffer System controlled by the micro VAX 11 computer. Experimental neutron energy spectra was compared to the theoretical Maxwellian distributed spectrum to determine the ratio of detected neutrons by detector and actual emitted neutrons from Cf-252 source. The actual emitted neutrons were measured by means of the fission chamber detector. This ratio of numbers of neutrons relates directly to the absolute efficiency value of the detector at each neutron-energy range. The absolute efficiency values for 5" diameter x 2 diameter thick detector are varied from 5% to 30% depending on the neutron energy range and neutron energy threshold. Experimental uncertainties are less than 1% for neutron-energy ranging from 1 to 10 MeV but increased to 5% above 10 MeV.

10696 (INIS-mf–14445, pp. E-3, 1-18) **A remote control neutron cone scanner and measurement of the d(T,n) α neutron cone.** Suwanakachorn, D. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

We have measured the neutron cone associated with alpha particles from the d(T,n)α reaction by using a remote-control cone scanner. This scanner has two principal parts. The first part is the neutron detector scanner which can move the detector in the horizontal and vertical axis using to stepping-motors. The neutron detector can be moved in 0.5 cm increments over the whole rage of 30 cm. The second part is the remote-control electronic circuit using digital ICs. The rotation of stepping-motors is controlled by pulse signals from this circuit and the position of the detector is known by counting the number of pulses. The position of the neutron detector is indicated directly on a 3 digit display at the control panel. The method of measuring the neutron cone by the Time-of-Flight technique is also described.

Characteristic TL- glow curves of both natural and synthetic $Ca_3(P\ O_4)_2$ powder have been investigated. Synthetic TL-samples, particularly those which have Ca/p ratio = 2.0, indicated improved glow curves with multi-peak spectra (at 75 degree C, 175 degree c and 300 degree C) and higher TL- sensitivity; about 73 n C/Gy for 3 mg powder sample. All investigated $Ca_3(P\ O_4)2$ samples showed nearly regular systematic dependence in their gamma-induced TL-response throughout a useful dose range, from about 1 Gy to about 10 KGy, which is proper for therapeutic and processing levels. The proper heat annealing course for regeneration of irradiated TL-samples was found to be about 350 degree C for 20 minutes. 4 figs.

(CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

A new type of a spectrometer invented by the author - the alpha-beta-gamma scintillation spectrometer - is described. With this spectrometer samples of alpha, beta, and gamma emitting radioisotopes can be measured. Gmma emitting can be measured with, or without the use of a liquid scintillator. The figure-of-merit values (E^2/B) obtained with this system in the counting of tritium and carbon-14 are superior to those obtained with conventional liquid scintillation spectrometers. The author expects that the new spectrometers will in future replace conventional liquid scintillation spectrometers. (author). 21 refs., 1 tab., 2 figs.

radioactivity - application of the routine measuring program in the five new Federal German States -, Berlin (Germany), 12-14 Oct 1992). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

The described Integrated Measuring and Information System for monitoring environmental radioactivity is a system which, making optimum use of current information technology, guarantees that an event with radiological consequences for the Federal Republic of Germany is detected early. The situation can be judged quickly and completely. The system ensures that measures adjusted to the situation can be initiated and thus impacts reduced to a minimum. The use of all available measuring techniques, of current models to simulate processes in the atmosphere, hydrosphere and ecosphere, as well as the modelling of effects of possible measures contributes to this end. Source: OSTI; NTIS (US Sales Only); INIS.

For spectroscopical measurements, alpha emitters have to be brought as near as possible to the detector, and their radiation must not be notably absorbed or slowed down neither within the measuring preparation itself, nor between measuring preparation and detector, because otherwise their energy would be displaced and dispersed. In practice this means that the measuring preparations must cover an area of less than about 30 $\mu g/cm^2$. Hence it follows that the most difficult probem subject to major errors consists in radiochemically separating the interesting radionuclides from the sample matrix, selectively and purely, and to produce a measuring preparation as thin as possible. This is very labour- and time-intensive. (orig./DG)

Source: OSTI; NTIS (US Sales Only); INIS.

Liquid scintillation measurement (LSC) after electrolytic enrichment, and counter gas measurement in the proportional counter tube prove to be almost equal. By means of electrolytical enrichment, both the scattering and accuracy of individual values and the deviation of the mean laboratory value from the set value for tritium detections in surface waters and precipitation can be guaranteed at present with a standard deviation of below 10%. With decreasing tritium contents in these media, LSC direct measurement is no longer able to determine them at all. Since these contents, however, are completely insignificant from the radiological point of view, the application of this not so expensive method in the area of environmental monitoring is justifiable. Radio-ecological studies and flow area related balancing, however, require the use of more sensitive enrichment methods or counter gas measurements in the proportional counter tube in order to obtain suitable results at all. The overview given is based on the actual state of national and international standardization. The foundations of detectability and detection limits, and their calculation are described. The specific problems resulting from different measurement methods are dealt with. The preparation and evaluation of measurement value collectives of different origin, in particular, if several data are indicated as

'below detection limit', must be performed according to standardized aspects. Some fundamental considerations related to this group of problems are also discussed. (orig./DG)

The official measuring points of the federal states to monitor environmental radiactivity have to meet certain demands on quality assurance, and prove to the competent authorities of the respective state that their laboratories performed the appropriate quality controls in the field of radioactivity measurements. Other laboratories performing radioactivity measurements also have to undertake regular quality controls. Laboratory-internal and external controls which form part of quality controls in laboratories are briefly described. (orig./DG)

The Office of Environmental Protection of Baden-Wuerttemberg in its capacity as a central measuring point of the Land undertakes important monitoring and coordination functions with regard to radioactivity detection. In addition, it controls, in the sense of an officially designated expert, other so-called external measuring points, most of them private ones, which are active in the state, and coordinates, according to the Precautionary Radiation Protection Law, together with the data center of the state residing in the same building, the measurement programs and activities of all four IMIS measuring points in Baden-Wuerttemberg. Radioactive materials in their manifold appearances in different types of samples covering a wide range of values, not only require well-trained laboratory personnel to ensure a high quality of methods and results, but also comprehensive measures which are outlined. One of the tasks of the Physicotechnical Federal Institution (PTB), in addition to the development of methods of representation and preservation of physical and technical units to ensure the uniformity of measures (nationally and internationally), is the transfer of such units. In the field of radioactivity this transfer is mainly performed by delivering activity standards and determining the activity of submitted samples. A description is given of how the activity of calibration preparations is determined and which types of activity standards with which specifications are available on the market for the calibration of radiation detectors. Routine acquisition of environmental radioactivity data is necessary in order to gather reference values for judging the radiological situation. Paragraph 3 of the Precautionary Radiation Protection Law provides a comprehensive framework for the federal states for the selection and definition of the environmental areas to be monitored. The required specification of the monitoring areas is given in the programs for monitoring radioactivity of the environment according to the above mentioned law, part 1 routine meaasuring program, and part 2 intensive measuring program. The routine measuring program covers above all environmental areas which contribute to a significant radiation exposure of man through his diet, and the dose relevance of which is decisive for man (food, medicine, animal feed and fertilizers, tobacco products, drinking and ground water, sewage). Irrespective of their dose relevance, environmental areas have been included in the monitoring program which are necessary to be able to supply a complete area-representative picture of the situation of environmental radioactivity, and at the same time enable to make statements on the transport of radioactive materials in the environment (e.g. soil measurements, studies of plants as indicators). Particle track reconstruction capabilities of the silicon tracking detector system have been studies. As the multiple Coulomb scattering (MCS) induces unavoidable uncertainties on the coordinate measurement, the corresponding error estimates and the associated correlations have been used to find the best track fit parameters and their errors. Finally it permits one to find the proper particle characteristics, as vertex position and resolution, momentum value, flight direction and the corresponding errors. (author). 6 refs., 4 figs., 4 tabs.

Lab. of Neutron Physics); Balagurov, A.M.; Simkin, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225–: International seminar on structural

investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

A high-resolution neutron powder Fourier diffractometer (HRFD) has been constructed at the pulsed reactor IBR-2 in Dubna. Immediately after the reactor shielding the mechanical filter, the neutron guide and the neutron Fourier-chopper are placed. The detector assembly consists of two position sensitive detector and the main detector with a total solid angle of 0.08 st. The electronics of HRFD is created using the modular RTOF analyser which is connected to the PC-computer (IBM-386). Preliminary results obtained by means of new HRFD are given. 3 refs., 10 figs.

10734 (JINR-E-3-93-65, pp. 29-40) **Present status of the diffractometer M.SFINSK.** Trounov, V.; Kudryashev, K.; Ul'yanov, V.; Bulkin, A.; Muratov, V.; Hiismaki, P.; Tiitta, A.; Antson, O.; Poyry, H. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The present status of the diffractometer M.SFINKS is considered. The Fourier diffractometer is installed at the PIK reactor in Gatchina. Some technical parameters of the M.SFINKS and achieved scientific results are presented. The aperture of the detector is 0.09 sterad. The resolution of the diffractometer M.SFINKS is 0.25%. Neutron flux at sample site equals to 1.5 x 10^7 n/cm^2 x s. 15 refs., 5 figs., 2 tabs.

10735 (JINR-E-3-93-65, pp. 41-54) **The Fourier chopper and RTOF acquisition system of HRFD and the upgraded mini-SFINKS.** Muratov, V.G.; Zhuravlev, V.V.; Tiitta, A.T. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

A new RTOF data acquisition system applicable both for pulsed and steady-state neutron sources will be shortly described. This data acquisition system is used in the HRFD and in the upgraded Mini-SFINKS of the PNPI, Gatchina. The RTOF analyzer is based on intelligent autonomous correlator modules and a master module used as an input data interface and a programmable time base for a set of correlator modules. The communication of the modular RTOF analyzer with a PC, used as a controlling host and a user interface to the system, takes place through a serial BITBUS. The measurement control and user interface software will be shortly described. 7 refs., 7 figs.

10736 (JINR-E-3-93-65, pp. 55-68) **Diffraction studies on the Fourier diffractometer at GKSS.** Priesmeyer, H.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

A Fourier correlation chopper operating in reverse time-of-flight mode has been designed and built as an instrument to perform non-destructive investigations of residual stresses in polycrystalline materials by time-of-flight neutron diffraction. The method is discussed and first results of the spectrometer's performance are presented. 9 refs., 8 figs.

10737 (JINR-E-3-93-65, pp. 146-162) **High resolution powder diffraction comparison between neutrons and synchrotron radiation.** Fuess, H. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

Some principles of high resolution powder diffraction with synchrotron radiation are presented together with details of the diffractometer at the B2-station at HASYLAB, DORIS (Hamburg). This instrument may be used either in a high angular resolution mode with maximum $\Delta d/d \approx 5 \times 10^{-4}$ or in a high time resolution mode with a minimum time for registration of a powder pattern of 2.5 msec. 14 figs., 3 tabs.

10738 (JINR-E-3-93-65, pp. 163-175) **Solutions for implementing time-of-flight techniques in low-angle neutron scattering, as realized on the low-Q diffractometer at Los Alamos.** Hjelm, R.P.; Seeger, P.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The implementation of small-angle (Low-momentum transfer) neutron scattering instruments at pulsed spallation sources, using time of flight methods, has meant the introduction of some new ideas in instrument design, data acquisition, data reduction and computer management of the experiment and the data. Here we recount some of the salient aspects of solutions for implementing time of flight small-angle neutron scattering instruments at pulsed sources, as realized on the LOW-Q Diffractometer, LQD, at Los Alamos. 10 figs.

10739 (JINR-E-3-93-65, pp. 176-184) **Development of small-angle diffractometer LQD at the ISIS pulsed neutron source.** Heenan, R.K.; King, S.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The SANS diffractometer LOQ at the ISIS pulsed neutron source is described. Data from neutron wavelength of 2.0-9.8 A are combined to give a simultaneous Q range of 0.006-0.22 A^{-1} at a sample-detector distance of 4.4 m. 6 figs.

10740 (JINR-E-3-93-65, pp. 185-193) **Presentation of new SANS instrument at the BER-2 reactor in Berlin, Germany.** Keiderling, U.; Wiedenmann, A.; Wagner, W. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

At the BER-2 reactor in Berlin, Germany, having recently been upgraded in neutron flux and equipped with a cold neutron source and a neutron guide system, a new SANS instrument has been installed at the curved guide NL3A. The main technical features of the instrument are presented, along with the description and the results of the calibration measurements completed so far. 2 refs., 7 figs.

10741 (JINR-E-3-93-65, pp. 194-211) **Comparison of SANS instruments at reactor and pulsed sources.** Thiyagarajan, P.; Epperson, J.E.; Crawford, R.K.; Carpenter, J.M.; Hjelm, R.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

Small angle neutron scattering is a general purpose technique to study long range fluctuations and hence has been applied in almost every field of science for material characterization. SANS instruments can be built at steady state reactors and at the pulsed neutron sources where time-of-flight technique are used. 8 figs.

10742 (JINR-E-10-94-328) **Application of Deformable Templates for Recognizing Tracks Detected with High Pressure**

Drift Tubes. Baginyan, S.; Baranov, S.; Glazov, A.; Ososkov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1994. 14p. Order Number DE95621870. Source: OSTI; NTIS (US Sales Only); INIS.

The modification of the deformable template method (DTM) application to the problem of track finding and track parameter determination for data detected with high pressure drift tubes (HPDT) in the design of ATLAS for the muon spectrometer experiment is proposed. Our DTM applications consist of two parts, according to two stages of the study. The first part relates to the stage of HPDT study on the CERN muon beam (BEAM-TEST) with the simplest one-prong events without noise signals, where the main obstacle is the left-right ambiguities for each tube. In the second part more complicated HPDT data are to be handled with noise signals. It was shown that the suggested DTM development solves the problem of track recognition and track parameter determination for both noiseless and noise data. Results are obtained on the real beam test data and on data simulating the muon spectrometer on the basis of HPDT. 14 refs., 10 figs.

10743 (JINR-E–13-94-351) **Cathode Readout with Stripped Resistive Drift Tubes.** Bychkov, V.N.; Kekelidze, G.D.; Novikov, E.A.; Peshekhonov, V.D.; Shafranov, M.D.; Zhil'tsov, V.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 11p. Order Number DE95621871. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to 'Vienna Wire Chamber Conference', Austria, Feb 1995.

A straw tube drift chamber prototype has been constructed and tested. The straw tube material is mylar film covered with carbon layer of resistivity 0.5, 30 and 70 k Ohm/sq. The gas mixture used was Ar/CH_4. Both the anode wire and cathode signals were detected in order to study the behaviour of the chamber in the presence of X-ray ionization. The construction and the results of the study are presented. 7 refs., 11 figs., 1 tab.

10744 (JINR-R–13-94-317) **Specific Characteristics of Spark Chambers Filled with Neon with Air Contamination.** Aksinenko, V.D. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy); Glagoleva, N.S.; Matyushin, A.T.; Matyushin, V.T.; Saitov, I.S.; Nurgozhin, N.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 11p. (In Russian). Order Number DE95621872. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Pribory i Tekhnika Ehksperimenta.

Attention is payed for specific features of characteristics of spark chambers filled with neon gas with some air contamination. Possibilities to apply them other than the possibility to control the memory time of streamer chambers are discussed. As a result of measurements of the attachment constant the cross sections of attachment of electrons and molecules of air, oxygen and saturated water vapor are calculated. The calculated values don't disagree with known values. (author). 7 refs., 7 figs.

10745 (KEK-PROC–94-2) **Proceedings of the 2nd JLC detector workshop. Experiment with polarized electron beam at e^+e^- colliders.** Fujii, Yoshiaki (ed.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Apr 1994. 379p. (In Japanese, English). (CONF-9402127–: 2. JLC Detector Workshop, Hakuba (Japan), 1-3 Feb 1994). Order Number DE95747973. Source: OSTI; NTIS; INIS.

As for the research on development for the construction of JLC, in the first 5 year project, the solution of all problems was found, and the trial manufacture of accelerator components was carried out. Following these successes, the High Energy Committee decided the second 3 year project in January, 1993. This aims at the general test by constructing the test accelerator to show that low emittance and multi-bunch beam can be created and accelerated, and the further heightening of the performance of accelerator components. In 1997, the concrete proposal on the first period construction of JLC will be made. This time, the workshop was held on February 1-3, 1994 in Hakuba, Nagano, for the development of measuring instruments, placing emphasis on the use of polarized electron beam. Lectures were given on the introduction to polarized linear collider, polarized electron source, muon detectors at LEP, vertex detector for JLC, R and D status of JLC-CDC test chamber, calorimeter status report, review of SPACAL, calorimeter-having finished beam test, state of analysis of DC beam test, results of analysis of silicon pad in JLC calorimeter beam test, survey of optical read-out devices in strong magnetic field, background and IR design for JLC-1, and FFTB and IR design status. (K.I.).

10746 (LA–12832-MS) **Dynamic-range tests for a gamma-ray sensor.** Byrd, R.C.; Longmire, J.L.; Moss, C.E. Los Alamos National Lab., NM (United States). Jan 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005907. Source: OSTI; NTIS; INIS; GPO Dep.

The task of detecting and characterizing intense bursts of nuclear radiation requires an instrument capable of operating reliably over wide extremes of signal intensity. Developing techniques for testing and calibrating such a detector involves a combination of experimental measurements, data analyses, and computer simulations. The results of these efforts provide important insight into the instrument's behavior in the laboratory and in its eventual application. For the present case, such studies not only verify the proper operation of the existing detector, but they also provide the basis for future improvements in its performance.

10747 (LA–12850-MS) **Monte Carlo calculations of the effective area and directional response of a polyethylene-moderated neutron counter.** Los Alamos National Lab., NM (United States). Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005908. Source: OSTI; NTIS; GPO Dep.

Two recent reports on Monte Carlo studies have examined the angular response of a multiple-rod neutron scintillator and the energy response of a moderated ^3He neutron counter. This report extends those studies to provide calculations of the effective area and angular sensitivity of a polyethylene-moderated neutron detector that has multiple ^3He tubes. The results (1) provide a more accurate and general determination of the sensor's detection efficiency, (2) suggest new techniques for obtaining information about the source direction, and (3) allow evaluation of proposals to improve the high-energy detection efficiency by using the production of (n,2n) neutrons in high-density material added to the moderator.

10748 (LA-UR–95-156) **Silicon subsystem mechanical engineering closeout report for the Solenoidal Detector Collaboration.** Hanlon, J.; Christensen, R.W.; Hayman, G.; Jones, D.C.; Ross, R.; Wilds, W.; Yeamans, S.; Ziock, H.J. Los Alamos National Lab., NM (United States). [1995]. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006336. Source: OSTI; NTIS; INIS; GPO Dep.

The authors group at Los Alamos National Laboratory was responsible for the mechanical engineering of the silicon tracking system of the Solenoidal Detector Collaboration (SDC) experiment of the Superconducting Super Collider (SSC) project. The responsibility included the overall design of the system from the mechanical point of view, development and integration of the cooling system, which was required to remove the heat generated by the front-end electronics, assembly of the system to extremely tight tolerances, and verification that the construction and operational stability and alignment tolerances would be met. A detailed description of the concepts they developed and the work they performed can be found in a report titled "Silicon Subsystem Mechanical Engineering Work for the Solenoidal Detector Collaboration" which they submitted to the SSC Laboratory. In addition to the mechanical engineering work, they also performed activation, background, and shielding studies for the SSC program. Much of the work they performed was potentially useful for other future high energy physics (HEP) projects. This report describes the closeout work that was performed for the Los Alamos SDC project. Four major tasks were identified for completion: (1) integration of the semi-automated assembly station being developed and construction of a precision part to demonstrate solutions to important general assembly problems (the station was designed to build precision silicon tracker subassemblies); (2) build a state-of-the-art TV holography (TVH) system to use for detector assembly stability tests; (3) design, build, and test a water based cooling system for a full silicon shell prototype; and (4) complete and document the activation, background, and shielding studies, which is covered in a separate report.

10749 (LA-UR–95-157) **Silicon subsystem mechanical engineering work for the solenoidal detector collaboration.** Miller, W.O. (and others); Barney, M.; Byrd, D.; Christensen, R.W.; Dransfield, G.; Elder, M.; Gamble, M.; Crastataro, C.; Hanlon, J.; Jones, D.C. Los Alamos National Lab., NM (United States). [1995]. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006300. Source: OSTI; NTIS; INIS; GPO Dep.

The silicon tracking system (STS) for the Solenoidal Detector Collaboration (SDC) represented an order of magnitude increase in size over any silicon system that had been previously built or even planned. In order to meet its performance requirements, it could not simply be a linear scaling of earlier systems, but instead required completely new concepts. The small size of the early systems made it possible to simply move the support hardware and services largely outside the active volume of the system. For a system five meters long, that simply is not an option. The design of the STS for the SDC experiment was the result of numerous compromises between the capabilities required to do the physics and the limitations imposed by cost, material properties, and silicon strip detector characteristics. From the point of view of the physics, the silicon system should start as close to the interaction point as possible. In addition, the detectors should measure the position of particles passing through them with no errors, and should not deflect or interact with the particles in any way. However, cost, radiation damage, and other factors limiting detector performance dictated, other, more realistic values. Radiation damage limited the inner radius of the silicon detectors to about 9 cm, whereas cost limited the outer radius of the detectors to about 50 cm. Cost also limits the half length of the system to about 250 cm. To control the effects of radiation damage on the detectors required operating the system at a temperature of 0°C or below, and maintaining that temperature throughout life of the system. To summarize, the physics and properties of the silicon strip detectors requires that the detectors be operated at or below 0°C, be positioned very accurately during assembly and remain positionally stable throughout their operation, and that all materials used be radiation hard and have a large thickness for one radiation length.

10750 (ORNL/TM–12817, pp. 449-456) **Establishing a ^{252}Cf source for neutron irradiations of dosimetry at the Idaho National Engineering Laboratory.** Perry, O.R. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Ruhter, P.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A 1991 DOE Tiger Team review of the dosimetry operations at the Idaho National Engineering Laboratory (INEL) concluded that the DOE providing both a program Overview and dosimeter irradiations to the EG&G program constituted a potential conflict of interest. Consequently, the Operational Dosimetry Unit (ODU) of EG&G moved the neutron irradiation program from the RESL Am-Be source to a ^{252}Cf source located in the Health Physics Instrument Laboratory (HPIL). To accomplish this move the ODU designed a DOELAP equivalent PMMA neutron phantom, designed and constructed an irradiation platform at HPIL, and developed a neutron correction factor based on ^{252}Cf for interpreting phosphor output. A testing protocol was constructed to develop a neutron correction factor for interpreting QA/QC dosimeter results.

10751 (ORNL/TM–12817, pp. 457-472) **Comparison of NIST and ISO filtered bremsstrahlung calibration beams.** Soares, C.G. (National Institute of Standards and Technology, Gaithersburg, MD (United States)); Ehrlich, M. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

For the purposes of international uniformity it is important that a consistent set of calibration beams be adopted for widespread use. To further this endeavor, ISO developed a standardized set of bremsstrahlung beam qualities which has been adopted for use in most of the world. It is proposed that they also be adopted in the US. To hasten this adoption it will be necessary to incorporate the ISO set of beams into the NIST set of standard calibration beams and into existing US test standards. In the following, a review is presented of available data for the calibration beams in use in different countries. The two main methods of specifying beam quality are discussed and examples are given for the measurement precision of the parameters employed in either. Finally, there is a presentation of current NIST endeavor to produce and characterize a series of ISO bremsstrahlung beams for instrument calibration in the United States.

10752 (ORNL/TM–12817, pp. 473) **Optimal filters for ISO K-fluorescence reference radiations.** Chen, Jing (Institute of Radiation Biology, Oberschleibheim (Germany)); Hsu, Hsioa-Hua. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In the document ISO 4037, 16 radiator materials with corresponding secondary filtration and primary electron beam energy are recommended for the production of reference radiations. For the filter materials, recommendations were made only for the minimum mass per unit area, which may not be the optimal thickness to achieve the highest purity. We used the Monte Carlo code ACCEPT of the integrated TIGER series to simulate ISO geometries. By varying the thickness of filters, we can find the optimal thickness required to achieve the highest purity for all reference radiations.

10753 (ORNL/TM–12817, pp. 475-479) **Establishing a uranium slab source for beta irradiations of dosimetry at the Idaho National Engineering Laboratory (INEL).** Bean, L.C.; Perry, O.R.; Ruhter, P.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) uses a DOELAP accredited Panasonic thermoluminescence dosimetry (TLD) system to provide photon and beta radiation monitoring. The Operational Dosimetry Unit (ODU) at the INEL manages the personnel dosimetry programs. As part of personnel dosimetry processing, the ODU includes TLDs that are irradiated to pre-determined dose equivalent levels using Cesium 137 and depleted uranium sources. These pre-irradiated dosimeters serve as Quality Assurance and Quality Control indicators of system performance. As a result of a potential conflict of interest, the ODU moved from a DOE provided irradiation service to contractor controlled sources for QA/QC irradiations. To accomplish this for beta irradiations, the ODU decided to duplicate the source, source container and geometry used by DOELAP in Category VB (uranium slab). The choice of the slab geometry supports the personnel algorithm which unfolds beta dose equivalency based on slab geometries.

10754 (ORNL/TM–12817, pp. 481-490) **Calibration standards using nuclides incorporated into polymeric membranes™ or polysurface™.** Strathearn, G.E. (Isotope Products Labs., Burbank, CA (United States)); Ramirez, A.R.; Khan, A.; Amlauer, K. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclides can be incorporated into organic-based materials, called polymeric membranes™ or polysurface™. These polymeric membranes™ have several distinct advantages over the more traditional methods of deposition, electroplating or an anodized layer. Alpha emitters can be incorporated into polymeric membranes™, but the best emitters for this method are beta (Sr/Y-90, T1-204, C-14, Cs-137, Pm-147 and Ge/Ga-68) and gamma emitters (Fe-55, I-125/-129/-131, Cs-137, Am-241, Co-57 and Eu- 152). To limit

beta-energy attenuation the nuclides are typically incorporated into a thin layer 1 mg/cm^2 thick. The organic layer is covered by a thin acrylic protection (approximately 200 μg/cm^2) and a thin conductive metal layer (approximately 100 μg/cm^2) of either gold or aluminum. Beta calibration of these standards is based upon electron flux from the surface of the source, and can be certified traceable to NIST. Contained activity can also be provided. Gamma calibration is based on either contained activity for high energy photon emitters or photon flux for low-energy sources.

10755 (ORNL/TM–12817, pp. 491-500) **Traceability of a panoramic gamma irradiator using different TLD systems as transfer instruments.** Romero, A.M. (CIEMAT, Madrid (Spain)); Saez-Vergara. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Quality Control Program in a TLD Personal & Environmental Dosimetry Service requires not only the calibration in a recognized reference laboratory but also amount of additional irradiations for daily controls, individual correction factors calculation, fading corrections and other purposes. These routine irradiations do not need metrological, quality to be performed, so that auxiliary equipments such as a self-contained panoramic gamma irradiator can be employed. However, it seems reasonable to characterize the response of these equipments to the reference laboratory.

10756 (PNL-SA–24177) **Gamma spectral analysis via neural networks.** Keller, P.E.; Kouzes, R.T. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941061–16: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95004908. Source: OSTI; NTIS; GPO Dep.

A system combining a portable gamma-ray spectrometer with a neural network is discussed. In this system, the neural network is used to automatically identify radioactive isotopes in real-time from their gamma-ray spectra. Two neural network paradigms are examined: the linear perceptron and the optimal linear associative memory (OLAM). A comparison of the two paradigms shows that OLAM is superior to linear perceptron for this application. Both networks have a linear response and are useful in determining the composition of an unknown sample when the spectrum of the unknown is a linear superposition of known spectra. One feature of this technique is that it uses the whole spectrum in the identification process instead of only the individual photo-peaks. For this reason, it is potentially more useful for processing data from lower resolution gamma-ray spectrometers. This approach has been successfully tested with data generated by Monte Carlo simulations and with field data from both sodium iodide and germanium detectors. With the neural network approach, the intense computation takes place during the training process. Once the network is trained, normal operation consists of propagating the data through the network, which results in rapid identification of samples in the field. This approach is useful in situations that require fast response but where precise quantification is less important.

10757 (PSI–95-04) **PSI's calibrating laboratory for radiation protection measuring instruments.** Gmuer, K. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Reischl, R. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Feb 1995. 34p. (In German). Order Number DE95621755. Source: OSTI; NTIS; INIS.

For many years the Paul Scherrer Institute has been calibrating radiation instruments for its own use and for external clients such as nuclear power plants, public services or private companies. In January 1993 the calibration laboratory has been awarded the status of a verification laboratory of the Swiss Confederation, authorized to verify measuring instruments for radiation protection as provided for by the new radiation protection ordinance. The accreditation procedure in cooperation with the Federal Office of Metrology enabled a critical review of the techniques and methods applied. Constraints for the verification activity were defined, and the compliance of the methods with the requirements of the quality guidelines was checked. The working field of the laboratory includes the verification of dose and dose rate meters for photons and neutrons, calibration of contamination monitors and dosimeters, and general testing of radiation protection instruments. In addition, high-dose irradiations of physical or biological samples are carried out. The laboratory has at its disposal two irradiation facilities housing six ^{137}Cs and three ^{60}Co gamma sources with a maximum air kerma rate of 50 Gy/h (1994), a ^{252}Cf- and a ^{241}Am-Be neutron source, two beta secondary standards and a 320-kV-Roentgen generator with filter series to produce X-ray spectra for radiation protection purposes. A set of point and area sources serve to calibrate contamination monitors for alpha, beta, and photon radiation. Verifications of photon and neutron dose and dose rate meters are traceable to primary standard laboratories by means of secondary or transfer standard instruments. The equipment and the procedures applied meet international standards and recommendations. Various radiation quantities such as exposure, air kerma, absorbed dose and the new operational dose equivalent quantities recommended by the International Radiation Units and Measurements are available.

10758 (WHC-SD-SQA-CSA–20383) **CSER 94-015: New portable NDA equipment for use in SNM audits.** Hess, A.L. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005166. Source: OSTI; NTIS; INIS; GPO Dep.

A criticality safety review is presented for the use of two portable NDA detectors from Los Alamos during an IAEA inspection of the SNM at PFP. The units are an Active Well Coincidence Counter (AWCC) and a High Level Neutron Coincidence Counter (HLNCC). Approval for their employment is based on the inherent safety of the containers to be assayed, one at a time, and because their designs conform with the acceptability criteria which allow the other NDA detectors currently employed at the facility.

10759 (JINR-R–14-94-355) **Analysis of Radiation Damages of Electronic Circuits by Separate Irradiation of Their Components with a Collimated Charged Particle Beam.** Wronski, W. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)); Didyk, A.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1994. 4p. (In Russian). Order Number DE95621946. Source: OSTI; NTIS (US Sales Only); INIS.

Some advantages of the comparative method of studying the radiation damages of electronic devices which includes parameter comparison of irradiated and test samples are shown. The analysis of damages is performed at separate irradiation of the electronic circuit components while its operation in the main regime of the device. The purposeful irradiation is carried out by a well-collimated charged particle beam, in this case the principle of simulation of different types of nuclear radiation in view of their damage abilities is used. Experiments have been performed with the scheme of an electronic digital watch. (author). 2 refs., 1 fig.

(CONF-9409177–4-Rev.11/94: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95005689. Source: OSTI; NTIS; GPO Dep.

All manufacturing processes involve errors. In the case of bare and multilayer mirrors these unavoidable errors introduce near-field fluctuations in the reflected wavefront which propagate to the far field and degrade imaging performance. In order to specify manufacturing tolerances in terms of performance requirements we must know the connection between the two – the finish-function relationship. This paper discusses the form of that relationship derived using elementary statistical diffraction theory. It tells us what statistical properties of the surface errors are relevant, it spells out the important role of the system parameters for EUV mirrors which is absent for conventional mirrors, and it leads to simple good-bad tests for mirror quality. These results are an extension of previous work in this area.

10763 (DOE/ER/60986–T2) **Single molecule detection using charge-coupled device array technology. Final report.** Denton, M.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemistry. Apr 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60986. Order Number DE95006425. Source: OSTI; NTIS; GPO Dep.

An ultra sensitive technique for the detection of fluorescent species in a flowing stream has been developed. The extension of this technique to the detection of fluorescently tagged nucleotides will be a significant benefit to one of the novel approaches for DNA sequencing being developed at Los Alamos National Laboratories. The detection scheme is based on a novel mode of operating a Charge-Coupled Device (CCD) which greatly enhances the discrimination between fluorescence from the analyte and the background Raman scattering from the solvent. Register shifts between rows in the CCD are synchronized with the sample flow velocity so that fluorescence from a single species is collected in a single moving charge packet occupying an area approaching that of a single pixel while the background is spread evenly among a large number of pixels. This research has demonstrated that this technique is highly effective for the detection of fluorescently labelled latex microspheres. With additional development, the authors believe that this technique will achieve single molecule detection.

10764 (EGG-M–94084) **Low-cost image analysis system.** Lassahn, G.D. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940536–2: 10. conference on geologic remote sensing: exploration, environment and engineering, San Antonio, TX (United States), 9-12 May 1994). Order Number DE95005021. Source: OSTI; NTIS; GPO Dep.

The author has developed an Automatic Target Recognition system based on parallel processing using transputers. This approach gives a powerful, fast image processing system at relatively low cost. This system scans multi-sensor (e.g., several infrared bands) image data to find any identifiable target, such as physical object or a type of vegetation.

10765 (ENEA-RT-INN–94-28) **Soil pollutants detection using a mobile Lidar Fluorosensor.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Fantoni, R.; Palucci, A.; Colao, F.; Ribezzo, S. ENEA, Frascati (Italy). Dipt. Fusione. Dec 1994. 16p. (In Italian). (CONF-9405284–1: Elettroottica '94, Pavia (Italy), 25-27 May 1994; RT/INN–94-28). Order Number DE95749704. Source: OSTI; NTIS (US Sales Only).

A general purpose mobile Lidar Fluorosensor has been designed and assembled at the ENEA (Italian Agency for New Technologies, Energy and the Environment) Centre in Frascati and has been extensively employed for environmental monitoring. The instrument is capable of remotely sensing the laser induced optical radiation from the illuminated targets, and to analyse it both in the spectral and in the temporal domains, in order to retreive chemical-physical features of the targets themselves. Applications to the detection of soil pollutants such as heavy metals and organic/inorganic compounds are presented here.

10766 (ENEA-RT-INN–94-33) **Report of third LASFLEUR field campaign for remote sensing of vegetation health: ENEA contribution.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Colao, F.; Fantoni, R.; Palucci, A.; Ribezzo, S. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 30p. (RT/INN–94-33). Order Number DE95749693. Source: OSTI; NTIS (US Sales Only).

The third european joint field campaign for remote sensing of vegetation health has been held in Avignon F (September 6th to 17th, 1993) in the frame of the EUREKA/LASFLEUR Project. The Italian group from ENEA (Italian Agency forn New Technologies, Energy and the Environment) participated to this campaign together with Germany, French and Swedish groups from different institutes. On the occasion of this campaign, the lidar fluorosensor system built at ENEA Frascati for remote sensing of water and territory has been improved with the addition of a new short pulse laser source more suitable to time resolved measurements. The new version of the set-up is presented here, together with the measurements performed on the available targets (different trees, maize and sorghum cultivations). Data analysis is discussed in detail, attempting to correlate the fluorescence measurements with the plant photosynthetic activity under different weather and (chemical- or water-) stress conditions.

10767 (ENEA-RT-INN–94-34) **Quantum yield measurements of photochemistry activity of plants exposed to pollutant gases.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Colao, F.; Fantoni, R.; Guarini, R.; Palucci, A.; Ribezzo, S.; Lorenzini, G.; Pucci, N.; Lipucci di Paola, M. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Oct 1994. 20p. (RT/INN–94-34). Order Number DE95749727. Source: OSTI; NTIS (US Sales Only).

Fluorescence measuring techniques on intact leaves are a simple tool to monitor plants under air pollutant stresses, like ozone and sulphur dioxide. The quantum yield represents one of the critical parameters to measure the photochemical efficiency of photosystem II. A novel technique based on a pump and probe double laser system was developed which applied the Genty's parameter to a laser induced fluorescence (LIF) technology. This method proved to be more sensistive than the PAM fluorometer to evaluate the early damage to photosystem II activity especially in spinach treated with ozone, in the absence of visible symptoms of injury. Marked increases in blue/red ratios were observed in spinach but not in ryegrass exposed to ozone. The response to a chronic sulphur dioxide was not appreciable.

10768 Apparatus and process for removing a predetermined portion of reflective material from a mirror. Perry, S.J.; Steinmetz, L.L. 1992. Filed date 29 Oct 1992. U.S. Patent Application 7-968,569. 25p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract W-7405-ENG-48. Order Number DE95006128. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Apparatus and process are disclosed for removal of a stripe of soft reflective material of uniform width from the surface of a mirror by using a blade having a large included angle to inhibit curling of the blade during the cutting operation which could result in damage to the glass substrate of the mirror. The cutting blade is maintained at a low blade angle with respect to the mirror surface to produce minimal chipping along the cut edge and to minimized the force exerted on the coating normal to the glass surface which could deform the flat mirror. The mirror is mounted in a cutting mechanism containing a movable carriage on which the blade is mounted to provide very accurate straightness of the travel of the blade along the mirror.

10769 (SAND–94-2920C) **Retrofitting a fine-pointing system to satellite optics.** Woods, R.O. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505124–1: 29. aerospace mechanisms symposium, Houston, TX (United States), 17-19 May 1995). Order Number DE95004529. Source: OSTI; NTIS; GPO Dep.

This paper describe a system that was added to an existing satellite-borne telescope design for the purpose of compensating the boresight errors that had been observed in earlier flights of similar instruments. Those errors had been found to be caused by thermal distortion of the spaceframe. This retrofit design was subject to severe volume restrictions because it was fitted into an already tightly-packaged instrument envelope. It was found practical to improve the basic design by converting a redundant structure into a statically-determinate one. It was also possible to use portions of the mechanical actuation system to facilitate the position encoding needed for computer interfacing.

10770 (SAND–95-8491C) **Direct ultrashort-pulse retrieval using frequency-resolved optical gating and a computational neural network.** Ladera, C.L.; DeLong, K.W.; Trebino, R.; Fittinghoff, D.N. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950396–1: Signal recovery and synthesis conference, Salt Lake City, UT (United States), 12 Mar 1995). Order Number DE95007148. Source: OSTI; NTIS; GPO Dep.

Previously, ultrashort-laser-pulse retrieval in Frequency-Resolved Optical Gating required an iterative algorithm. Here, however, we use a computational neural network for directly recovering pulses.

10771 (ANL/CHM/PP–80430) **Nuclear magnetic resonance tomography with a toroid cavity detector.** Woelk, K.; Rathke, J.W.; Klingler, R.J. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95007081. Source: OSTI; NTIS; GPO Dep.

A new type of nuclear magnetic resonance (NMR) tomography has been developed at Argonne National Laboratory. The method uses the strong radio frequency field gradient within a cylindrical toroid cavity to provide high-resolution NMR spectral information while simultaneously resolving distances on the micron scale. The toroid cavity imaging technique differs from conventional magnetic resonance imaging (MRI) in that NMR structural information is not lost during signal processing. The new technique could find a wide range of applications in the characterization of surface layers and in the production of advanced materials. Potential areas of application include in situ monitoring of growth sites during ceramic formation processes, analysis of the oxygen annealing step for wires coated with high-temperature superconducting films, and investigation of the reaction chemistry as a function of distance within the diffusion layer for electrochemical processes.

10772 (DOE/ET/15601–52) **Diagnostic development and support of MHD test facilities. Final progress report, March 1980–March 1994.** Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. Order Number DE95007070. Source: OSTI; NTIS; GPO Dep.

The Diagnostic Instrumentation and Analysis Laboratory (DIAL) at Mississippi State University (MSU), under U.S. Department of Energy (DOE) Contract No. DE-AC02-80ET-15601, Diagnostic Development and Support of MHD Test Facilities, developed diagnostic instruments for magnetohydrodynamic (MHD) power train data acquisition and for support of MHD component development test facilities. Microprocessor-controlled optical instruments, initially developed for Heat Recovery/Seed Recovery (HRSR) support, were refined, and new systems to measure temperatures and gas-seed-slag stream characteristics were developed. To further data acquisition and analysis capabilities, the diagnostic systems were interfaced with DIAL's computers. Technical support was provided for the diagnostic needs of the national MHD research effort. DIAL personnel also cooperated with government agencies and private industries to improve the transformation of research and development results into processes, products and services applicable to their needs. The initial contract, Testing and Evaluation of Heat Recovery/Seed Recovery, established a data base on heat transfer, slagging effects on heat transfer surfaces, metal durability, secondary combustor performance, secondary combustor design requirements, and other information pertinent to the design of HR/SR components at the Coal-Fired Flow Facility (CFFF). To accomplish these objectives, a combustion test stand was constructed that simulated MHD environments, and mathematical models were developed and evaluated for the heat transfer in hot-wall test sections. Two transitions occurred during the span of this contract. In May 1983, the objectives and title of the contract changed from Testing and Evaluation of Heat Recovery/Seed Recovery to Diagnostic Development and Support of MHD Test Facilities. In July 1988, the research laboratory's name changed from the MHD Energy Center to the Diagnostic Instrumentation and Analysis Laboratory.

10773 (KCP–613-5411) **Metrology measurement capability.** Shroyer, K. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jan 1995. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95005411. Source: OSTI; NTIS; GPO Dep.

During the past 36 years, the Kansas City Division's (KCD) Metrology Department has developed measurement technology and calibration capability in four major areas of measurement: (1) Mechanical; (2) Environmental, Gas, Liquid; Electrical (D.C., A.C., RF/Microwave); and (3) Optical and Radiation. The capabilities developed include unique capabilities in many areas of measurement and engineering expertise to develop measurement techniques and resolve measurement problems in these major areas. KCD Metrology was established in 1958 to provide a measurement base for the Kansas City Plant. The Metrology Engineering Department provides the expertise to develop measurement capabilities for virtually any type of measurement which falls into the broad areas listed above. The engineering staff currently averages almost 19 years of measurement experience. A strong audit function has been developed to provide a means to evaluate the calibration programs of our suppliers and internal calibration organizations. This evaluation includes measurement audits and technical surveys. The requirements placed on Metrology require traceability of measurements to the National Institute of Standards and Technology or to nationally recognized methods or natural phenomena. A description of Metrology capabilities, traceability flow charts, and the measurement uncertainty of each of the measurement capabilities is contained in the following pages.

10774 (KCP–613-5452) **CMM functional software evaluation (algorithm qualification). Final report.** Cummins, J.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas

City Div. Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95006178. Source: OSTI; NTIS; GPO Dep.

The mathematical algorithms for geometric features contained in proprietary coordinate measuring machine (CMM) vendor's software were tested by standardized data set applications and results were compared with known algorithm outputs. The CMM vendor's proprietary software requirements shield the user from visibility of the actual equations programmed into the coded software routines. All that is visible to the CMM inspector is the input data and the resulting output. Details of how those results were calculated from sample probing data would not typically be visible. Therefore, to gain rigorous confidence that the CMM inspection routines function as desired, independent testing was performed using sets of data with known results. Comparisons with the known results then verified functional algorithm acceptance. Agreement to the fifth and sixth decimal place was common.

10775 (LA-SUB–95-1) **Development of a portable mass spectrometric system for determination of isotopic composition of solid uranium samples using fluorine volatilization. Final report.** Loge, G. Los Alamos National Lab., NM (United States). 30 Sep 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005728. Source: OSTI; NTIS; INIS; GPO Dep.

Using hardware and materials supplied by LANL, a prototype quadrupole mass spectrometer system designed for portable field analysis of isotopic composition of solid uranium samples was assembled and tested. The system contained the capability for fluorine volatilization of solid uranium samples with gas introduction, which was successfully tested and demonstrated using 100 mg samples of U_3O_8. Determination of precision and accuracy for measuring isotopic composition was performed using isotopic standards. Use with soil samples containing uranium were also attempted. Silicates in the soil forming SiF_4 were found to be a kinetic bottleneck to the formation of UF_6. This could be avoided by performing some sort of chemical separation as a pre-treatment step, which was demonstrated using nitric acid.

10776 (LA-UR–94-3114) **Technology information profile: Long-Range Alpha Detector (LRAD).** Bounds, J.A. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006448. Source: OSTI; NTIS; INIS; GPO Dep.

The idea to develop some sort of radiation detection using this knowledge was passed down and after extensive and groundbreaking development, practical and sensitive devices were invented that are particularly sensitive to alpha radiation. Well over twenty different LRAD detectors have been successfully built and plans exist for many more. No parallel work is known to exist, and the ability to detect alpha radiation at such distances is unequaled.

10777 A Rolamite acceleration sensor. Abbin, J.P.; Briner, C.F.; Martin, S.B. 1992. Filed date 29 Oct 1992. U.S. Patent Application 7-968,563. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006129. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a rolamite acceleration sensor which has a failsafe feature including a housing, a pair of rollers, a tension band wrapped in an S shaped fashion around the rollers, wherein the and has a force-generation cut out and a failsafe cut out or weak portion. The failsafe cut out or weak portion breaks when the sensor is subjected to an excessive acceleration so that the sensor fails in an open circuit (non-conducting) state permanently.

10778 Fiber optic hydrophone. Kuzmenko, P.J.; Davis, D.T. 1992. Filed date 30 Oct 1992. U.S. Patent Application 7-968,950. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006125. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a miniature fiber optic hydrophone based on the principles of a Fabry-Perot interferometer. The hydrophone, in one embodiment, includes a body having a shaped flexible bladder at one end which defines a volume containing air or suitable gas, and including a membrane disposed adjacent a vent. An optic fiber extends into the body with one end terminating in spaced relation to the membrane. Acoustic waves in the water that impinge on the bladder cause the pressure of the volume therein to vary causing the membrane to deflect and modulate the reflectivity of the Fabry-Perot cavity formed by the membrane surface and the cleaved end of the optical fiber disposed adjacent to the membrane. When light is transmitted down the optical fiber, the reflected signal is amplitude modulated by the incident acoustic wave. Another embodiment utilizes a fluid filled volume within which the fiber optic extends.

10779 Device for aqueous detection of nitro-aromatic compounds. Reagen, W.K.; Schulz, A.L.; Ingram, J.C.; Lancaster, G.D.; Grey, A.E. 1992. Filed date 21 Dec 1992. U.S. Patent Application 7-993,552. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95006115. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention relates to a compact and portable detection apparatus for nitro-aromatic based chemical compounds, such as nitrotoluenes, dinitrotoluenes, and trinitrotoluene as (TNT). The apparatus is based upon the use of fiber optics using filtered light. The preferred process of the invention relies upon a reflective chemical sensor and optical and electronic components to monitor a decrease in fluorescence when the nitro-aromatic molecules in aqueous solution combine and react with a fluorescent polycyclic aromatic compound.

10780 (PNL-SA–24974) **Technical design issues for a field-portable supercritical fluid extractor.** Wright, B.W.; Zemanian, T.S.; Robins, W.H.; Wright, C.W. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 15p. Sponsored by Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950163–1: 3. international on-site analysis conference, Houston, TX (United States), 22-25 Jan 1995). Order Number DE95007265. Source: OSTI; NTIS; GPO Dep.

Supercritical fluid extraction is gaining acceptance as an alternative sample preparation method for trace organic analysis. The development of SFE instrumentation optimized for field use requires taking several technical design issues including size and weight requirements, user-friendly operation, and technical performance capabilities into consideration. Parameters associated with a prototype SFE instrument under development for potential use in conducting on-site inspections of the Chemical Weapons Convention and its preliminary technical and operational performance are described.

10781 (WHC-SD-W007H-ATP–001) **BCP selector valves and limit switches.** Rippy, G.L. Westinghouse Hanford Co., Richland, WA (United States). 30 Sep 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002085. Source: OSTI; NTIS; GPO Dep.

This document contains information about the Acceptance Test Procedure to demonstrate that the electrical/instrumentation systems for the BCP stream function as required by project criteria. Topics discussed include: References to engineering drawings and specifications; responsibilities of the project engineer, test director, records recorder, test operator, design engineer, and project manager; occupational safety and health; test performance; and what to do with exceptions.

45 MILITARY TECHNOLOGY, WEAPONRY, AND NATIONAL DEFENSE

10782 (ANL/DIS/CP–82494) **ELIST (the Enhanced Logistics Intra-Theater Support Tool), a tool for analyzing theater movement constraints.** Van Groningen, C.N.; Macal, C.M.; Braun, M.D. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9411103–2: 1994 Institute of Electrical and Electronics Engineers conference on tolls with artificial intelligence, New Orleans, LA (United States), 6 Nov 1994). Order Number DE95005862. Source: OSTI; NTIS; GPO Dep.

ELIST was conceived to allow for the detailed analysis of logistical deployment plans while simplifying the initial data entry and reducing the time required for a complete analysis. ELIST allows users to build hierarchical theater infra-structure networks (airports, seaports, road, rail, pipeline) using a graphical interference, perform discrete event simulations of deployment plans ("scenarios") which are developed on standard military planning systems, and analyze the results using textual, tabular, and graphical output at various levels of detail.

10783 (CONF-9408136–3) **Telerobotic excavation system for unexploded ordnance retrieval.** Burks, B.L. (Oak Ridge National Lab., TN (United States). Robotics and Process Systems Div.); Killough, S.M.; Thompson, D.H.; Rossi, R.A. Oak Ridge National Lab., TN (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 26. Department of Defense explosives safety seminar; Miami, FL (United States); 16-18 Aug 1994. Order Number DE95006738. Source: OSTI; NTIS; GPO Dep.

The small emplacement excavator (SEE) is a ruggedized military vehicle with backhoe and front loader used by the US Army for unexploded ordnance (UXO) retrieval and general utility excavation activities. In order to evaluate the feasibility of removing personnel from the vehicle during high-risk excavation tasks a development and demonstration project was initiated to evaluate performance capabilities of the SEE under telerobotic control. A technology demonstration of the TSEE was conducted at McKinley Range, Redstone Arsenal, Huntsville, Alabama on 13–17 September, 1993. The primary objective of the demonstration was to evaluate and demonstrate the feasibility of remote UXO retrieval. During the demonstration, explosive ordnance disposal specialists were instructed on telerobotic operation of the TSEE, and then were asked to complete a simulated UXO retrieval task. Participants then submitted an evaluation of the system including human factors performance data. This presentation will describe the TSEE, retrieval demonstration, and summarize results of the performance evaluations. Some examples of the results are given below. Seventy percent of the demonstration participants found the tasks were as easy or easier to accomplish utilizing the remote system than with an unmodified system. Similarly, eighty percent of the participants found the TSEE hand controller was as easy or easier to use than the normal manual controls.

10784 (SAND–94-2344C) **Tungsten carbide fragmentation: Experimental characterization and numerical modelling.** Hertel, E.S. Jr.; Grady, D.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950537–1: 15. international symposium on ballistics, Haifa (Israel), 21-24 May 1995). Order Number DE95008521. Source: OSTI; NTIS; GPO Dep.

Tungsten Carbide is a high density ceramic (generally found in ceramic/metal mixtures) with attractive shear and tensile strength properties in certain ballistic applications. We have determined a Hugoniot elastic limit of ~4 GPa, followed by strong hardening behavior, with spall strengths of 2.7–3.6 GPa. In addition, a series of experiments where Tungsten Carbide spheres impacted PMMA indicates that a sharp transition to fine-grained fragmentation occurred at impact velocities between 2.4 and 2.9 km/s. The well-characterized experiments described above were used to assess the effectiveness of CTH in predicting the axial and radial dispersion of the projectile after break-up. CTH has a fracture model that relies on a P_{min} criteria to allow computational void to relieve a tensile condition. Comparisons with the experimental data were made using the P_{min} model and an additional model based on an energy-based theory of Grady and Kipp. We found that the simple models are not capable of predicting the complex fragmentation behavior seen in the experiments.

10785 (SAND–94-3095) **Independent nuclear safety assessment of the non-nuclear verification instrument NNV-470AS.** Summers, D.A. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006201. Source: OSTI; NTIS; INIS; GPO Dep.

The System Surety Assessment Department 12332 of Sandia National Laboratories performed an independent nuclear safety assessment of the Non-nuclear Verification Instrument NNV-470AS. The NNV-470AS was assessed for structural integrity, characteristics of its electrical circuits, and its Radiated Electrical Emissions. Department 12332 concluded that the NNV-470AS and its Operational Procedures are safe to use with war reserve weapons. However, strict adherence to the Operational Procedures for the NNV-470AS is needed to prevent tampering with the instrument.

10786 (UCRL-ID–119289) **Performance analysis of bullet trajectory estimation: Approach, simulation, and experiments.** Ng, L.C.; Karr, T.J. Lawrence Livermore National Lab., CA (United States). 8 Nov 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95007949. Source: OSTI; NTIS; GPO Dep.

This paper describes an approach to estimate a bullet's trajectory from a time sequence of angles-only observations from a high-speed camera, and analyzes its performance. The technique is based on fitting a ballistic model of a bullet in flight along with unknown source location parameters to a time series of angular observations. The theory is developed to precisely reconstruct, from firing range geometry, the actual bullet trajectory as it appeared on the focal plane array and in real space. A metric for measuring the effective trajectory track error is also presented. Detailed Monte-Carlo simulations assuming different bullet ranges, shot-angles, camera frame rates, and angular noise show that angular track error can be as small as 100 μrad for a 2 mrad/pixel sensor. It is also shown that if actual values of bullet ballistic parameters were available, the bullet s source location variables, and the angles of flight information could also be determined.

4501 Chemical Explosions and Explosives

10787 (ANL/ESD/TM–77) **Environmental geophysics at J-Field, Aberdeen Proving Ground, Maryland.** Daudt, C.R.; McGinnis, L.D.; Miller, S.F.; Thompson, M.D. Argonne National Lab., IL (United States). Nov 1994. 73p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95007494. Source: OSTI; NTIS; GPO Dep.

Geophysical data collected at J-Field, Aberdeen Proving Ground, Maryland, were used in the characterization of the natural hydrogeologic framework of the J-Field area and in the identification of buried disturbances (trenches and other evidences of contamination). Seismic refraction and reflection data and electrical resistivity data have aided in the characterization of the leaky confining unit at the base of the surficial aquifer (designated Unit B of the Tertiary Talbot Formation). Excellent reflectors have been observed for both upper and lower surfaces of Unit B that correspond to stratigraphic units observed in boreholes and on gamma logs. Elevation maps of both surfaces and an isopach map of Unit B, created from reflection data at the toxic burning pits site, show a thickening of Unit B to the east. Abnormally low seismic compressional-wave velocities suggest that Unit B consists of gassy sediments whose gases are not being flushed by upward or downward moving groundwater. The presence of gases suggests that Unit B serves as an efficient aquitard that should not be penetrated by drilling or other activities. Electromagnetic, total-intensity magnetic, and ground-penetrating radar surveys have aided in delineating the limits of two buried trenches, the VX burning pit and the liquid smoke disposal pit, both located at the toxic burning pits site. The techniques have also aided in determining the extent of several other disturbed areas where soils and materials were pushed out of disposal pits during trenching activities. Surveys conducted from the Prototype Building west to the Gunpowder River did not reveal any buried trenches.

10788 (SAND–94-2255) **A design guide and specification for small explosive containment structures.** Marchand, K.A. (Southwest Research Institute, San Antonio, TX (United States)); Cox, P.A.; Polcyn, M.A. Sandia National Labs., Albuquerque, NM (United States); Southwest Research Inst., San Antonio, TX (United States). Dec 1994. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007316. Source: OSTI; NTIS; GPO Dep.

The design of structural containments for testing small explosive devices requires the designer to consider the various aspects of the explosive loading, i.e., shock and gas or quasistatic pressure. Additionally, if the explosive charge has the potential of producing damaging fragments, provisions must be made to arrest the fragments. This may require that the explosive be packed in a fragment attenuating material, which also will affect the loads predicted for containment response. Material also may be added just to attenuate shock, in the absence of fragments. Three charge weights are used in the design. The actual charge is used to determine a design fragment. Blast loads are determined for a "design charge", defined as 125% of the operational charge in the explosive device. No yielding is permitted at the design charge weight. Blast loads are also determined for an over-charge, defined as 200% of the operational charge in the explosive device. Yielding, but no failure, is permitted at this over-charge. This guide emphasizes the calculation of loads and fragments for which the containment must be designed. The designer has the option of using simplified or complex design-analysis methods. Examples in the guide use readily available single degree-of-freedom (sdof) methods, plus static methods for equivalent dynamic loads. These are the common methods for blast resistant design. Some discussion of more complex methods is included. Generally, the designer who chooses more complex methods must be fully knowledgeable in their use and limitations. Finally, newly fabricated containments initially must be proof tested to 125% of the operational load and then inspected at regular intervals. This specification provides guidance for design, proof testing, and inspection of small explosive containment structures.

10789 (SAND–94-3048C) **Photocatalysis for the destruction of aqueous TNT, RDX, and HMX.** Showalter, S.K.; Prairie, M.R.; Stange, B.M.; Rodacy, P.J.; Leslie, P.K. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941255–1: Life cycles of energetic materials, Del Mar, CA (United States), 11-16 Dec 1994). Order Number DE95006469. Source: OSTI; NTIS; GPO Dep.

The photo-destruction of the high explosives HMX, RDX and TNT was investigated using two systems (ozone versus titanium dioxide), two reactors (pot vs annular reactor), and two types of lamps (1000 Watt Hg-Xe vs 25 Watt LP Hg). A mass balance was performed on reactions executed under pseudo-solar conditions, and relative reaction rates and products were compared for ozone and titanium dioxide based processes. The ratios of relative product formation is also discussed. Results show that there was little difference in the reactions performed in the annular reactor when either ozone or titanium oxide were used. The chemistry of RDX and HMX are very similar, as expected. Future work involving the mechanism is also discussed.

10790 (SAND–94-8508) **A compatibility study of containment materials in FEFO, bis-(2-fluoro-2,2-dinitroethyl) formal.** Shepodd, T.J. (Sandia National Labs., Livermore, CA (United States)); Goods, S.H.; Moddeman, W.E.; Foster, P. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007548. Source: OSTI; NTIS; GPO Dep.

We report on a program to evaluate the compatibility of energetic fluids with candidate containment materials. The energetic fluids are constituents of various extrudable explosives developed by Lawrence Livermore National Laboratory. These paste-like explosives consist of explosive particulates (HMX, TATB for example) suspended in mixtures of energetic liquids and are designed to remain extrudable over a wide temperature range for many years. It is important to preclude or minimize interactions between the constituents of the paste and the containment materials since such interactions could result in decreased reliability or failure of the containment vessel as well as intrinsic changes in the flow or explosive characteristics of the paste. In this report we focus on one specific paste formulation: RX-52-AE (Transferable Insensitive Explosive, TIE), composed principally of the solid explosive TATB and the energetic liquid, FEFO. Compatibility between a number of organic and metallic materials with neat FEFO has been evaluated. The 300 series stainless steels, Al 6061-T6, and Monel 400 showed evidence of surface attack (oxidation or pitting). Polished gold coupons became discolored and XPS analysis revealed the formation gold cyanide. Platinum, iridium, titanium, tantalum and Ta-10% W showed little evidence of reaction. Among the organic materials, the per-fluorinated materials showed only slight interaction with the FEFO while the polyethylene, polyester and Aclar® materials were attacked by the liquid. These interactions were manifested in changes in color, net weight gain and mechanical properties. The changes were exaggerated by higher temperatures.

10791 (BARC–1994/E/017) **An interactive system for seismic signal detection and identification.** Roy, Falguni (Bhabha Atomic Research Centre, Bombay (India). High Pressure Physics Div.); Basu, T.K. Bhabha Atomic Research Centre, Bombay (India). 1994. 47p. Order Number DE95618646. Source: OSTI; NTIS (US Sales Only); INIS.

The methods to distinguish an underground explosion from an earthquake are mainly based on exploiting the differences in the source functions of the two processes and locating the depth of source. Various characteristics of seismic signals generated by these sources are usually represented by different parameters or identifiers. However, it is not possible for a single identifier to distinguish an explosion from an earthquake with equal effectiveness in all situations. Usually a combination of several identifiers is found to provide effective means for the identification of seismic sources. In order to use the multiple parameters in an optimum way, an interactive system (IS) for detection and identification of global events has been developed using short period data of Gauribidanur array. This report describes the salient features of the IS and demonstrates its effectiveness in identifying an event using weighted combination of the parameters together with the depth of source. It is intended to augment the system with long period data in the next phase of the development. (author). 37 refs., 14 figs., 2 tabs.

10792 (DOE/EIS–0161-Vol.1) **Draft programmatic environmental impact statement for tritium supply and recycling.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of Reconfiguration. Feb 1995. 782p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95008082. Source: OSTI; NTIS; GPO Dep.

Tritium, a radioactive gas used in all of the Nation's nuclear weapons, has a short half-life and must be replaced periodically in order for the weapon to operate as designed. Currently, the Nation has no tritium production capability. The Tritium Supply and Recycling PEIS evaluates the alternatives for the siting, construction, and operation of tritium supply and recycling facilities at each of five candidate sites: the Idaho Engineering Laboratory, the Nevada Test Site, the Oak Ridge Reservation, the Pantex Plant, and the Savannah River Site. Alternatives for new tritium supply and recycling facilities consist of four different tritium supply technologies; Heavy Water Reactor, Modular High Temperature Gas-cooled Reactor, Advanced Light Water Reactor, and Accelerator Production of Tritium. The PEIS also evaluates the impacts of using a commercial light water reactor, either as a contingency in the event of a national emergency or if purchased by the DOE and converted to defense purposes. Additionally, the PEIS includes an analysis of multi-purpose reactors which would produce tritium, dispose of plutonium and produce electricity. Volume I contains the findings of these analyses, Volume II contains the Appendices and supporting data.

10794 (DOE/NV–209-Rev.14) **United States nuclear tests, July 1945 through September 1992.** USDOE Nevada Operations Office, Las Vegas, NV (United States). Office of External Affairs. Dec 1994. 107p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006143. Source: OSTI; NTIS; GPO Dep.

This document lists chronologically and alphabetically by name all nuclear tests and simultaneous detonations conducted by the United States from July 1945 through September 1992. Several tests conducted during Operation Dominic involved missile launches from Johnston Atoll. Several of these missile launches were aborted, resulting in the destruction of the missile and nuclear device either on the pad or in the air.

10795 (LA–9211-C-Vol.1) **Proceedings of the Monterey Containment Symposium, Monterey, California, August 26-28, 1981. Volume 1.** Hudson, B.C. (comp.) (Lawrence Livermore National Lab., CA (United States)); Jones, E.M. (comp.); Keller, C.E. (comp.); Smith, C.W. (comp.). Los Alamos National Lab., NM (United States). Feb 1983. 417p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-810884–Vol.1: Monterey containment symposium, Monterey, CA (United States), 26-28 Aug 1981). Order Number DE95005739. Source: OSTI; NTIS; GPO Dep.

Since the Atmospheric Test Ban Treaty was signed in 1963, the United States has conducted all nuclear weapons tests underground. To meet US treaty responsibilities and to ensure public safety, the containment community must prevent any release of radioactive gases to the atmosphere. In the past two decades we have gained considerable insight into the scientific and engineering requirements for complete containment, but the papers and discussions at the Monterey Symposium indicate that a great deal remains to be done. Among papers included here, those dealing with mature topics will serve as reviews and introductions for new workers in the field. Others, representing first looks at new areas, contain more speculative material. Active research topics include propagation of stress waves in rocks, formation and decay of residual hoop stresses around a cavity, hydrofracture out of a cavity, formation of chimneys, and geologic and geophysical investigations of the Nevada Test Site. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

10796 (SAND–94-3238C) **JUNIOR JADE - containment phenomenology of decoupled events.** Smith, C.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950157–1: Nuclear testing evasion symposium, Washington, DC (United States), 10-12 Jan 1995). Order Number DE95006222. Source: OSTI; NTIS; GPO Dep.

With five 8 pound high-explosive experiments, the author has investigated aspects of the containment phenomenology of partially decoupled events. In three experiments he observed multiple fractures and little cavity growth. In the final two experiments there were no fractures and cavity volumes grew by factors of approximately two and three. With the five experiments a spectrum of results ranging from hydraulic fracture - like crack propagation through multiple fracture propagation to the no fracture, or fully contained, case, was observed. For the multiple fracture experiments a partial residual stress field may have controlled the release of the cavity pressure. Measurements of cavity pressure versus time provided containment diagnostics; post event mining allowed visual observation of the cavities and fractures.

4503 Nuclear Explosion Detection

10797 (LA-UR–93-4450) **Nighttime sensitivity of ionospheric techniques for detecting explosions.** Fitzgerald, T.J. Los Alamos National Lab., NM (United States). 14 Dec 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-26. Order Number DE95005258. Source: OSTI; NTIS; GPO Dep.

The detection of explosions using ionospheric techniques relies on measuring perturbations induced in radio propagation by acoustic waves which disturb the electron density of the ionosphere. We have proposed such techniques as a supplement to seismic for discrimination of underground nuclear explosions from commercial mining explosions. The nighttime ionosphere presents a difficulty for the detection of explosions because in the absence of solar ionizing radiation the electron density in the altitude range of 90 to 200 km decays after sunset and perturbation effects are correspondingly reduced. On the other hand, acoustic waves produced by weak explosions reach a maximum amplitude in the altitude range of 100 to 150 km and are highly attenuated at altitudes above 200 km. For safety reasons, most planned explosions are conducted during daylight which has limited our experimental measurements during nighttime. However a recent opportunity for a nighttime measurement occurred in connection with the Non-Proliferation Experiment which consisted of the detonation of a large chemical charge underground at the Nevada Test Site near midnight local time. Our results, based on a new technique of using medium frequency radio transmissions provided by commercial broadcasts to detect explosion effects, were negative. Although discouraging, this result need not defeat our goal of developing an ionospheric technique for discrimination of mining explosions because the majority of such events are conducted during daylight.

10798 (SA-PUB–1/94) **The Finnish research programme on climate change. Second progress report.** Kanninen, M.; Heikinheimo, P. (eds.). Academy of Finland, Helsinki (Finland). 1994. 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The second progress report of the Finnish Research Programme on Climate Change (SILMU). This volume, like the first, comprises contributions from the individual research projects included in the programme. The aim of these contributions is to describe the progress made in research during 1992-93, to illustrate the problem setting and lay out of the research work, and to present the results obtained to date. The Finnish Research Programme on Climate Change (SILMU) is a multidisciplinary national research programme on climate and global change. The principal goals of SILMU are: To increase our knowledge on climate change, its causes, mechanisms and consequences, to strengthen the research on climate change in Finland, to increase the participation of Finnish researchers in international research programmes, and to prepare and disseminate information for policy makers on adaptation and mitigation. The key areas where research is being directed are: quantification of the greenhouse effect and the magnitude of anticipated climatic changes, assessment of the effects of changing climate on ecosystems, and development of mitigation and adaptation strategies.

10799 (BNL–61078) **The effects on photosynthetic CO_2 assimilation to long-term elevation of atmospheric CO_2 concentration: An assessment of the response of Trifolium Repens L. cv. Blanca grown at F.A.C.E.** Lewis, C.E. Brookhaven National Lab., Upton, NY (United States). Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005687. Source: OSTI; NTIS; GPO Dep.

Understanding how photosynthetic capacity acclimates to elevated CO_2 concentrations is vital in predicting the response of important grassland species such as Trifolium repens. Previous studies of acclimatization have been carried out in artificial experimental conditions, such as acrylic greenhouses or controlled environment chambers. The advent of FACE technology has enabled a large area of crop to be fumigated in the field, providing more realistic growing conditions. Pure stands of Trifolium repens L. cv. Blanca grown at either 355 or 600μmol mol^{-1} CO_2 were examined, and their photosynthetic response to elevated Ca determined via gas exchange studies. Rates of photosynthesis of young, fully expanded leaves were increased between 21 and 36% when grown and measured at elevated CO_2. This increase in A corresponded to a decrease in g_S of between 18 and 52%. No acclimation effect was observed in the most frequently cut stands, whilst the response of stands clipped only 4 times per year was more variable. When down regulation of V_{cmax} did occur, this was not nearly as marked as that which occurred in 3 other temperate species (Chrysanthemum leucanthemum, Ranunculus friesianus, Plantago lanceolata (L.) J. & C. Presl.), at similar growth regimes. No acclimation of stomatal frequency, SI or pore length was found to occur in the enriched clover stands.

10800 (BNL–61220) **The whitehouse effect: shortwave radiative forcing of climate by anthropogenic aerosols.** Schwartz, S.E. Brookhaven National Lab., Upton, NY (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9409255–2: Conference on aerosols and atmospheric optics: radiation balance and visual air quality, Snowbird, UT (United States), 25-30 Sep 1994). Order Number DE95005998. Source: OSTI; NTIS; INIS; GPO Dep.

Increases in atmospheric concentrations of carbon dioxide and other infrared active gases over the industrial period are thought to have increased the average flux of longwave (thermal infrared) radiation between the surface of the earth and the lower atmosphere, leading to an increase in global mean temperature. Over the same period it is though that concentrations of aerosol particles in the troposphere have similarly increased as a consequence of industrial emissions and that these increased concentrations of particles have increased the earth's reflectivity of shortwave (solar) radiation incident on the planet both directly, by scattering radiation, and indirectly, by increasing the reflectivity of clouds. The term "whitehouse effect" is introduced to refer to this increased scattering of shortwave radiation by analogy to the term "greenhouse effect," which refers to the enhanced trapping of longwave radiation resulting from increased concentrations of infrared active gases. Each of these phenomena is referred to as a "forcing" of the earth's climate, that is a secular change imposed on the system; such a forcing is to be distinguished from a "response" of the system, such as a change in global mean temperature or other index of global climate. The forcing due to the direct and indirect effects induced by anthropogenic aerosols has been estimated to be comparable in global- average magnitude to that due to increased concentrations of greenhouse gases, but it is of opposite direction, that is exerting a cooling influence. The shortwave radiative influence of anthropogenic aerosols may thus be considered to be offsetting some, perhaps a great fraction, of the longwave radiative influence of anthropogenic greenhouse gases.

10801 (BNL–61427) **Anomalous cloud absorption? A critique of the paper entitled "Absorption of Solar Radiation by Clouds: Observations Versus Models".** Imre, D.G.; Abramson, E. Brookhaven National Lab., Upton, NY (United States). Feb 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95007703. Source: OSTI; NTIS; GPO Dep.

In a recent paper R. Cess and co-authors attempt to prove that general- circulation-models of the atmosphere do not correctly calculate short-wave absorption by cloudy sides. Co-located satellite and surface measurements are used to assess the relative effects of clouds on short-wave fluxes at both the top of the atmosphere and at the surface. The differences, expressed as average, Cloud-Radiative-Forcing (CRF) ratios, am evaluated both directly from measured fluxes and indirectly from plots of the Top-Of-Atmosphere (TOA) albedo against transmission. The two different analyses are then connected via their equation 1. Our study of the paper raised the serious concern that, due to unexamined uncertainties in their analyses, their final conclusions are not well founded. Herein, we give critiques of their two basic methods of analysis, referred to as "the slope" and "the direct CRF" methods.

10802 (CONF-911080–2) **Global warming and end-use efficiency implications of replacing CFCs.** Fairchild, P.D.; Fischer, S.K. Oak Ridge National Lab., TN (United States). [1991]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Meeting customers needs with heat pumps - 1991; Dallas, TX (United States); 15-18 Oct 1991. Order Number DE95007151. Source: OSTI; NTIS; GPO Dep.

The direct contribution of CFCs to calculated global warming has been recognized for some time. As a result of the international agreement to phase out CFCs due to stratospheric ozone and the ensuing search for suitable alternatives, there has recently been increased attention on the DIRECT global warming potential (GWP) of the fluorocarbon alternatives as greenhouse gases. However, to date there has been little focus on the INDIRECT global warming effect arising from end-use efficiency changes and associated CO_2 emissions. A study being conducted at Oak Ridge National Laboratory (ORNL) addresses this combined or total global warming impact of viable options to replace CFCs in their major energy-related applications. This paper reviews selected results for air-conditioning, refrigeration, and heat pump applications. The analysis indicates that the CFC user industries have made substantial progress in approaching near-equal energy efficiency with the HCFC/HFC alternative refrigerants. The findings also bring into question the relative importance of the DIRECT (chemical-related) effect in many applications. Replacing CFCs is an important step in reducing the total global warming impact, and at present the HCFC and HFCS appear to offer the best efficiency and lowest total impact of options available in the relatively short time period required for the transition away from CFCs.

10803 (CONF-9303255–) **Diode laser-based sensor system for long-path absorption measurements of atmospheric concentration and near-IR molecular spectral parameters.** Goldstein, N.; Lee, J.; Adler-Golden, S.M.; Bien, F. Spectral Sciences, Inc., Burlington, MA (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER81196. From 207. American Chemical Society (ACS) national meeting; San Diego, CA (United States); 13-18 Mar 1993. Order Number DE95006911. Source: OSTI; NTIS; GPO Dep.

Line-locked near-IR diode lasers and a simple retroreflector/telescope system were used for remote sensing of atmospheric constituents over long atmospheric paths. The experimental configuration used in preliminary measurements of atmospheric water vapor and oxygen with AlGaAs diode lasers is presented. A prototype field sensor system currently under development shares the same basic configuration but incorporates interchangeable AlGaAs and InGaAsP diode-laser modules for monitoring a variety of atmospheric gases.

10804 (CONF-931046–) **Automated remote monitoring of toxic gases with diode-laser-based sensor systems.** Goldstein, N.; Lee, J.; Bien, F. Spectral Sciences, Inc., Burlington, MA (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract FG02-91ER81196. Contract NAS8-39839. From International symposium on optical

sensing for environmental monitoring; Atlanta, GA (United States); 11-15 Oct 1993. Order Number DE95006910. Source: OSTI; NTIS; GPO Dep.

There is a growing need for compact sensor systems that provide reliable and automated monitoring of toxic gases and pollutants. Near infrared (NIR) diode lasers, originally developed for the communications industry, have the necessary reliability for use in such automated sensor systems. The authors combine NTR lasers with its patented line-locked absorption techniques to create the DiRTiGAS family of automated sensor systems for continuous remote monitoring of gas concentration. A broad variety of small polyatomic gases can be detected using GaAs-based diode lasers. They report here tests on NO_2, O_2, NH_3, C_2H_2, and CO_2 with two source modules operating at 760 and 1,540 nm, respectively. The DiRTiGAS family of remote sensors uses modular components which can be assembled in two basic configurations for process control and ambient air monitoring. The fiber-optic configuration uses a central control unit linked by a fiberoptic network to remote sensor heads. The long-path configuration uses a similar control unit and a distant retroreflective target to monitor the concentration in the intervening distances. A fieldable prototype longpath unit, and a fiber-optic head has been developed for process water vapor monitoring in exhaust stacks at temperatures up to 650 C. This work describes laboratory tests of both systems, and preliminary field tests of the prototype long-path system. Based on these results, they have made design revisions which will be incorporated in a second stage long-path prototype. This prototype will be ready for site tests in early 1994.

10805 (CONF-9411144–4) **A comparison of NH_3 point monitoring and diode laser based path integrated measurements.** Goldstein, N. (Spectral Sciences, Inc., Burlington, MA (United States)); Richtsmeier, S.C.; Lee, J.; Bien, F.; Fetzer, G.J.; Groff, K.W. Spectral Sciences, Inc., Burlington, MA (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER81196. From Optical sensing for environmental and process monitoring; McLean, VA (United States); 7-10 Nov 1994. Order Number DE95006892. Source: OSTI; NTIS; GPO Dep.

Measurements made using two different types of ammonia monitors during a two-month field study in the summer of 1994 are discussed. The first was a diode-laser based open path monitor designed for automated operation in an industrial environment. The second is a monitoring analyzer based on thermal decomposition of ammonia to NO and subsequent analysis by O_3-NO chemiluminescence. The two monitors provided consistent measurements of ammonia concentration during weeks of continuous unattended operation.

10806 (CONF-950124–5) **The distribution of cloud cover over the former USSR as derived from the RIHMI 223-Station 3-hourly meteorological database.** Kaiser, D.P. (Oak Ridge National Lab., TN (United States)); Vose, R.S.; Karl, T.R.; Razuvaev, V.N. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 75. annual meeting of the American Meteorological Society: diamond anniversary; Dallas, TX (United States); 15-20 Jan 1995. Order Number DE95007046. Source: OSTI; NTIS; GPO Dep.

In recent years a great deal of meteorological and climatological data has been exchanged between the two principal climate data centers of the United States and the former Soviet Union: the National Climatic Data Center (NCDC), in Asheville, North Carolina, and the Research Institute of Hydrometeorological Information (RIHMI) in Obninsk, Russia. This was accomplished via Working Group VIB (Influence of Environmental Changes on Climate) of the bilateral initiative known as the Agreement on Protection of the Environment, established on May 23, 1972 by the United States and the USSR. One of the key datasets compiled by RIHMI includes 3-hourly meteorological observations from 223 USSR stations for the period 1966-83. RIHMI has chosen to use daily and hourly data from these stations as the basis for considerable climate research efforts. These data (hereafter referred to as the RIHMI database) will soon be made available by both NCDC and the Department of Energy's Carbon Dioxide Information Analysis Center (CDIAC) in Oak Ridge, Tennessee. The data have undergone extensive quality assurance checks at RIHMI, NCDC, and CDIAC. The data contain observations of some 22 meteorological variables, including near-surface air temperature, sea level pressure, precipitation amount, weather type, and total cloud cover. This study uses the RIHMI database to examine the spatial distribution of total cloud cover over the former USSR (hereafter referred to as the USSR). In this initial assessment, we focus on comparing our results with total cloud cover data presented in the atlas: Global Distribution of Total Cloud Cover and Cloud Type Amounts Over Land for the common data period 1971-81.

10807 (DOE/CE/23810–48E) **Products of motor burnout. Quarterly technical report, June 6, 1994–September 30, 1994.** Hawley-Fedder, R. (Lawrence Livermore National Lab., CA (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). 21 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (UCRL-ID–118670). Order Number DE95007073. Source: OSTI; NTIS; GPO Dep.

Literature searches related to thermal and electrical decomposition products from R-22 R-134a, R-125 and R-143a have been conducted. A test cell has been designed for high pressure and temperature tests. Alternative refrigerants and lubricants have been ordered and received. LLNL required safety documentation has been processed in preparation for refrigerant/lubricant testing in the second and third quarters of the project.

10808 (DOE/CH/10575–T2) **Application of modern diagnostic methods to environmental improvement. Annual progress report, January–October 1994.** Shepard, W.S. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. Dec 1994. 193p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93CH10575. Order Number DE95005797. Source: OSTI; NTIS; INIS; GPO Dep.

The Diagnostic Instrumentation and Analysis Laboratory (DIAL), a research department in the College of Engineering at Mississippi State University (MSU), is under contract with the US Department of Energy (DOE) to develop and apply advanced diagnostic instrumentation and analysis techniques to real world processes; measurements are made in hot, highly corrosive atmospheres in which conventional measurement devices are ineffective. Task 1 of this agreement is concerned with the development and application of various diagnostic methods to characterize the plasma properties, the melt properties and the downstream emissions from a plasma torch facility designed to vitrify mixed waste. Correlation of the measured properties with the operating parameters of the torch will be sought to improve, optimize and control the overall operation of the plasma treatment process. As part of this program, diagnostic methods will be developed and evaluated for characterization, monitoring and control purposes of treatment processes in general. Task 2 of this agreement is concerned with the development of a system to monitor and control the combustion stoichiometry in real time in order to minimize environmental impact and maximize process efficiency. Staged fuel injection is also being studied to minimize NO_x formation.

10809 (EGG–11265-4018) **The challenge of emergency response dispersion models on the meso-gamma urban scale: A case study of the July 26, 1993 oleum tank car spill in Richmond, California.** Baskett, R.L. (EG and G Energy Measurements, Inc., Pleasanton, CA (United States)); Vogt, P.J.; Schalk, W.W. III; Pobanz, B.M.; Foster, C.S.; Ellis, J.S. EG and G Energy Measurements, Inc., Pleasanton, CA (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC08-93NV11265. (CONF-950430–2: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95003627. Source: OSTI; NTIS; INIS; GPO Dep.

Atmospheric modeling of accidental toxic chemical releases requires accurate simulation of wind flows on the 1 to 25 km (meso-γ) scale. Complex meteorological fields have been a challenge to real-time emergency response models for decades especially when,wind observations are sparse. 'ne Gaussian model is a reasonable tool for the first few kilometers if the terrain is relatively flat, the wind flow is simple (no vertical structure), and

meteorological data are available at the source. Most other situations demand three-dimensional models. Three-dimensional diagnostic wind field models depend on available meteorological observations which are subsequently adjusted by mass conservation to create a wind field over the terrain. Even in urban areas with multiple meteorological stations, 3-D diagnostic models may suffer from a lack of sufficient real-time observations. Deterministic models are stressed even more during variable low wind speed or stable atmospheric conditions, especially if the release is denser-than-air. Furthermore, typical wind direction measurement errors of 5 to 10 degrees extrapolated 10 or 20 km cause significant dislocations of downwind concentrations. This paper presents a recent case study that illustrates the difficulty of modeling accidental toxic releases in urban areas.

10810 (ENEA-RT-AMB–93-19) **Results of some models of near-field dispersion of effluents from submerged outfalls.** Iacovelli, M. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa); Marri, P. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa. Nov 1993. 25p. (In Italian). (RT/AMB–93-19). Order Number DE95749686. Source: OSTI; NTIS (US Sales Only).

The processes controlling the dispersion of effluents discharged from submerged outfalls, are numerous and complicated. For the management of the water quality near the discharge point it is very important to have instruments to evaluate the near-field dispersion that depends on the hydrological properties of the body receptor and the effluents, on the current velocity and on the technical characteristics of the outfall. For this object it's possible to use many mathematical models. In this paper it's described the results of some models that are simple and very pratical.

10811 (ENEA-RT-AMB–94-12) **Atmospheric aerosol monitoring in urban areas and near motorways with high traffic rate.** Castellani, C.M. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute). ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Mar 1994. 21p. (In Italian). (RT/AMB–94-12). Order Number DE95749718. Source: OSTI; NTIS (US Sales Only).

An increasing attention has been recently drawn to atmospheric aerosol for problems related to inhalation toxicology and access of very fine (so called ultrafine, UF) particles in the deepest regions of the human respiratory tract. In the frame of inhalation toxicology, evaluations and measurements related to particle size distribution of the aerosol are thus needed. In this paper a brief review of current knowledge about UF atmospheric aerosol is made, namely granulometric determinations performed in the 70s with the usual classification of atmospheric aerosol in three modes (nuclei, accumulation and coarse modes). Results deriving from two measurement campaigns are presented. The first one was performed in an urban area and was developed over three different seasons; the second one was carried out in September 1992 near an alpine motorway with high traffic rate. Results related to diffusive granulometries in number by means of a channel-type diffusion battery and aerodynamic granulometries in mass by means of a low-pressure type Berner impactor are discussed. Mode's parameters and aerosuspended masses division between modes are discussed in relation to type of emission, atmospheric dispersion and ageing of the aerosol.

10812 (ETDE-DE–20) **Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU). Annual report 1992.** Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU), Garmisch-Partenkirchen (Germany). 1993. 163p. (In German). Order Number DE95746469. Source: OSTI; NTIS (US Sales Only).

This progress report published by Fraunhofer-Institut fuer Atmosphaerische Umweltforschung, Garmisch-Partenkirchen, summarizes the institute's scientific and technical activities of 1992. The research projects on man-made changes in the biogeochemical cycles and the resulting global and regional environmental problems, e.g. greenhouse effect, photochemical ozone formation (photosmog) and increase in the intensity of UV-B radiation were continued. Increasing importance is attached to investigations into the effects of these environmental impacts on the biosphere and on the chemistry of the atmosphere. The IFU projects are integrated into international joint research projects. IFU took charge of central functions within the European environmental EUROTRAC project, the SANA environmental project and the international quality assurance center (QASAC) which was established recently. (orig.)

10813 (ETDE-DE–36) **Stratospheric climate and variability from a general circulation model and observations. Pt. 1. Results for the December-February season.** Report - Max-Planck-Institut fuer Meteorologie, v. 148. Manzini, E.; Bengtsson, L. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Nov 1994. 47p. (In German). Order Number DE95756112. Source: OSTI; NTIS (US Sales Only).

The climate and variability of the large scale stratospheric circulation during the Northern Hemisphere winter are studied comparing atmospheric statistics from a model simulation and from global observations. The simulation consisted of a 20-year integration performed with a newly developed comprehensive, low resolution model of the troposphere and stratosphere. The observations were compiled by Randel (1992) from a 12-year dataset of NMC-CAC global operational analyses of the troposphere and stratosphere. The December-February time average of the observed zonal mean circulation is found to be reasonably well captured by the model. In the stratosphere, the magnitude of the simulated and observed zonal winds compares well, although the simulated westerly winds do not show the equatorward tilt with height present in the observations. Associated with the polar confinement of the westerly winds is a relatively small symstematic cold bias in the polar lower stratosphere and upper troposphere. The quasi-stationary planetary waves are also well captured by the long term time averaged fields of the model. A considerable amount of monthly interannual variability is also found in the simulation. Both the NMC-CAC and model datasets show that in the stratosphere the interannual variability increases from December to January and February. The magnitude of the simulated interannual variability compares well with that observed during January and February. In December, however, the interannual variability simulated by the model appears to be severely underestimated in the upper troposphere and, locally, in the lower stratosphere. (orig.)

10814 (ETDE-DE–37) **Statistical downscaling of winter monthly mean North Atlantic sea-level pressure to sea level variations in the Baltic Sea.** Report - Max-Planck-Institut fuer Meteorologie, v. 150. Heyen, H. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Zorita, E.; Storch, H. von. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Dec 1994. 22p. Order Number DE95756013. Source: OSTI; NTIS (US Sales Only).

The term "downscaling" describes a procedure in which information about a process with a certain characteristic scale is derived from other processes with larger scales. The present paper identifies a relationship between the main components of the North Atlantic sea-level pressure (characteristic length-scale > 1000 km) and the sea level at several Baltic Sea gauges (10 km - 100 km). Monthly means from twenty observed winters are used to fit a statistical model that describes the dependence between both parameters. Further observations from this century are used to validate this model, which is able to estimate sea level anomalies from the sea-level pressure field to a good level of approximation. Sea level variations with periods from months to decades are reproduced well. The wind-stress is identified as the main forcing of the sea level variations. An observed trend in sea level within the last 90 years is found to be mostly iso- and eustatic. Sea-level pressure from a climate model experiment is used to estimate sea level anomalies in the case of increasing atmospheric CO_2-concentration. The result does not indicate a change from the present state. (orig.)

10815 (FAAR–24/1993) **Effects of nitric acid vapor on the formation of cloud droplets in troposphere.** Korhonen, P. (Helsinki Univ. (Finland). Dept. of Physics). Finnish Association for Aerosol Research, Espoo (Finland). 1993. 103p. (In Finnish). Order Number DE95744869. Source: OSTI; NTIS.

The effects of nitric acid vapor on the formation of cloud droplets in tropospheric conditions are studied in this work. The concentration of nitric acid in the polluted areas can be hundred times to that in the background areas. The effects of the changing cloud droplets concentration on the shortwave radiative properties of the cloud are also briefly studied. The formation of the cloud droplets is studied with an air parcel model describing the formation of a

convective cloud. The simultaneous condensation of water and nitric acid vapour on the soluble sodium nitrate ($NaNO_3$) particles is included in the model. The formation of the cloud droplets is simulated with different initial aerosol particle distributions and initial nitric acid concentrations. The concentrations of aerosol particles and nitric acid are varied from measured background values to values measured in heavily polluted areas. The properties of the simulated cloud, such as liquid water content, supersaturation of water vapor, the vertical velocity of rising air parcel and the amount of nitrate ions in the droplets, are compared to measured values and they have been found to be quite realistic. According to the obtained results the increase of the concentration of nitric acid vapor from background values (0.1 ppbv) ease remarkably the formation of cloud droplets. This leads to the higher amount of smaller cloud droplets in the forming cloud. The rise of the amount of nitric acid from the used background value to the 1 ppbv increased the amount of the cloud droplets so, that the albedo of the thin cloud layer (less than 1 km) was clearly increased and its absorbtivity was somewhat decreased.

10816 (HMI-B–519) **Lagrangian dispersion simulation for the radiation protection. Programme description of the system ParSiS.** Rekowski, M. von; Wiesner, G. Hahn-Meitner-Institut Berlin GmbH (Germany). Bereich Datenverarbeitung und Elektronik. May 1994. 50p. (In German). Order Number DE95754087. Source: OSTI; NTIS (US Sales Only); INIS.

The programme system ParSiS (Parallele Simulation im Strahlenschutz) was developed in order to determine the position and dispersion of a cloud of radioactive substances and the resulting radiation exposure at the ground by various exposure paths (whole-body χ-submersion, whole-body inhalation, whole-body ground radiation, whole-body χ-submersion and whole-body inhalation) in an area of up to 25 km around the place of emission. The packet is based upon a lagrangian model for the simulation of the dispersion of emitted substances by the air path. At the emission of radioactive substances an additional calculation of various radiation exposures near to the ground can be carried out. The programme system has been implemented into a parallel computer system (Transputer-Cluster), since there are only a few minutes available for a prognosis of an accidental dispersion over a period of several hours. In order to take into account actual radiological and meteorological data and to present the results, an on-line-connection to the monitoring system for radiation protection has been set up. (orig.)

10817 (INIS-mf–14445, pp. F-1, 1-10) **Determination of sulfur dioxide in ambient air and in industrial stack using X-ray fluorescence technique.** Sumitra, T. (Chulalongkorn Univ., Bangkok (Thailand). Dept. of Nuclear Technology); Chankow, N.; Punnachaiya, S.; Laopaibul, R. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Sulfur dioxide is a major air pollutant of concern. The gas has to be monitored both in ambient air and in industrial stacks. There are several methods of measuring sulfur dioxide. Standard methods adopted for Thailand are based on chemical methods. These are normally sensitive to light and temperature changes. Therefore a method of collecting air sample and determination of SO_2 by X-ray fluorescence technique was developed. Air sampling was done by an in-house low cost air sampler using automobile battery, dependency on a.c. source was thus avoided. The air pump has a flow rate between 0.2-1.5 liters/minute and draw about 0.6 A from a 12 V battery. SO_2 was collected on 37 mm filters impregnated with 5% sodium carbonate. This method could detect SO_2 from 10 μg up. The method has been checked by interlaboratory comparison. Field test has also been performed at some tobacco curing plants in Amphoe Sansai, Changwat Chiengmai, both in ambient air and in stacks. The results were found to be satisfactory and comparable with the standard methods.

Source: OSTI; NTIS (US Sales Only); INIS.

A precondition for the functionality of the decentrally organized system IMIS-IT is the clear-cut distribution of tasks and competences in an operational concept. It distinguishes between task areas which are handled centrally by the Federal Office of Radiation Protection, in particular by the ZdB and task areas which are handled decentrally by Land data centers, federal authorities and Land state measuring points. An overview of the IMIS-IT network with its hardware and software components is provided. (DG)

10820 (INIS-mf–15085, pp. 71-77) **Progress report on the "Regulatory Guide on emission and immission monitoring of nuclear facilities".** Korn, H. The relevant regulations for emission and immission monitoring of nuclear facilities under the atomic and radiation protection legislation of the Federal Republic of Germany are the Paragraph 46, 48 of the Radiation Protection Ordinance. The monitoring principles laid down there were revised. The amendments adopted on 12-06-1991 by the Federation/States working group primarily relate to emission monitoring measures of nuclear power plants during events/accidents including the controlled depressurization of the containment, and during the decommissioning phase, as well as emission and immission monitoring measures of fuel cycle facilities. (orig./DG)

10821 (INIS-mf–15095) **On the relations between the oceanic uptake of CO_2 and its carbon isotopes.** Report - Max-Planck-Institut fuer Meteorologie. Heimann, M.; Maier-Reimer, E. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Nov 1994. 41p. Order Number DE95752145. Source: OSTI; NTIS (US Sales Only); INIS.

The recent proposals to estimate the oceanic uptake of CO_2 by monitoring the oceanic change in $^{13}C/^{12}C$ isotope ratio or the air-sea $^{13}C/^{12}C$ isotopic disequilibrium is reviewed. Because the history of atmospheric CO_2 and $^{13}CO_2$ since preindustrial times is almost the same, the oceanic penetration depth of both tracers must be the same. This dynamic constraint permits the establishment of yet a third method to estimate the global ocean uptake of CO_2 from ^{13}C measurements. Using available observations in conjunction with canonical values for the global carbon cycle parameters the three methods yield inconsistent oceanic CO_2 uptake rates for the time period 1970-1990, ranging from 0 to over 3 GtC $year^{-1}$. However, uncertainties in the available carbon cycle data must be taken into account. Using a non-linear estimation procedure, a consistent scenario with an oceanic CO_2 uptake rate of 2.2 ± 0.8 GtC $year^{-1}$ can be established. The method also permits an investigation of the sensitivities of the different approaches. An analysis of the results of two three-dimensional simulations with the Hamburg Model of the Oceanic Carbon Cycle shows that the ^{13}C isotope indeed tracks the oceanic penetration of anthropogenic CO_2. Because of its different time history, bomb produced radiocarbon, as measured at the time of GEOSECS, correlates much less well to excess carbon. (orig.)

10822 (INIS-mf-15097) **On the intra-seasonal variability within the extratropics in the ECHAM3 general circulation model.** Report - Max-Planck-Institut fuer Meteorologie, v. 147. May, W. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Oct 1994. 210p. Order Number DE95752249. Source: OSTI; NTIS (US Sales Only); INIS.

First we consider the GCM's capability to reproduce the midlatitude variability on intra-seasonal time scales by a comparison with observational data (ECMWF analyses). Secondly we assess the possible influence of Sea Surface Temperatures on the intra-seasonal variability by comparing estimates obtained from different simulations performed with ECHAM3 with varying and fixed SST as boundary forcing. The intra-seasonal variability as simulated by ECHAM3 is underestimated over most of the Northern Hemisphere. While the contributions of the high-frequency transient fluctuations are reasonably well captured by the model, ECHAM3 fails to reproduce the observed level of low-frequency intra-seasonal variability. This is mainly due to the underestimation of the variability caused by the ultra-long planetary waves in the Northern Hemisphere midlatitudes by the model. In the Southern Hemisphere midlatitudes, on the other hand, the intra-seasonal variability as simulated by ECHAM3 is generally underestimated in the area north of about 50 southern latitude, but overestimated at higher latitudes. This is the case for the contributions of the high-frequency and the low-frequency transient fluctuations as well. Further, the model indicates a strong tendency for zonal symmetry, in particular with respect to the high-frequency transient fluctuations. While the two sets of simulations with varying and fixed Sea Surface Temepratures as boundary forcing reveal only small regional differences in the Southern Hemisphere, there is a strong response to be found in the Northern Hemisphere. The contributions of the high-frequency transient fluctuations to the intra-seasonal variability are generally stronger in the simulations with fixed SST. Further, the Pacific storm track is shifted slightly poleward in this set of simulations. For the low-frequency intra-seasonal variability the model gives a strong, but regional response to the interannual variations of the SST. (orig.)

10823 (ITRI-144) **Inhalation Toxicology Research Institute annual report, October 1, 1993–September 30, 1994.** Belinsky, S.A.; Hoover, M.D.; Bradley, P.L. (eds.). Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. Nov 1994. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. Order Number DE95007526. Source: OSTI; NTIS; INIS; GPO Dep.

This document from the Inhalation Toxicology Research Institute includes annual reports in the following general areas: (I) Aerosol Technology and Characterization of Airborne Materials; (II) Deposition, transport, and clearance of inhaled Toxicants; (III) Metabolism and Markers of Inhaled Toxicants; (IV) Carcinogenic Responses to Toxicants; (V) Mechanisms of carcinogenic response to Toxicants; (VI) Non carcinogenic responses to inhaled toxicants; (VII) Mechanisms of noncarcinogenic Responses to Inhaled Toxicants; (VIII) The application of Mathematical Modeling to Risk Estimates. 9 appendices are also included. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

10824 (IVL-B–1164) **Use of critical loads and other possible concepts for environmental impact assessments. Part 1.** Loevblad, G.; Skaerby, L. Swedish Environmental Research Inst., Goeteborg (Sweden). Feb 1995. 46p. (In Swedish). Order Number DE95744984. Source: OSTI; NTIS.

This report is the first report from the project 'Use of critical loads and other possible concepts for environmental impact assessment'. The aim of the project is to find ways of using e.g. critical loads in the planning of new energy production plants. The first step in the work includes emissions of sulphur and nitrogen. Emissions from a plant must be seen from a system point of view. In case a new plant using new technology replaces an existing one, the net change in emissions may be a decrease. A complication is that many areas in southern Sweden are heavily influenced from European emissions. Contribution from one single emission source to total air concentrations, deposition, environmental effects and to critical loads and levels is in many cases very small. A first step in the environmental planning process is to decide upon acceptable amounts of local emissions. A number of ways of comparing the emissions in different regions have been tested, such as amounts emitted in relation to area, number of inhabitants, and to local critical loads. The emissions of sulphur in Sweden have decreased with 80% in relation to the base year 1980. This is equivalent to the reduction agreed upon until the year 2010 in the new sulphur protocol. From a national point of view sulphur emission abatements are less important than other environment measures. Areas with high spatial emissions, around the largest cities and areas where the local deposition contributions exceed the critical loads may be exceptions. For nitrogen oxides, only minor changes in emissions have occurred between 1985 and today. Major reductions might be expected during the next ten years. The Swedish ecosystems will also benefit from decreases in the rest of Europe. The continuation of the work will deal with ozone and greenhouse gases.

10825 (JINR-E–3-93-61, pp. 148-151) **Solid state track detector (SSTD) investigation of aerial hot particles in radioactive contaminant zones of the republic Belarus.** Zhuk, I.P. (and others). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 205p. (CONF-9203318–: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. Aerosol particles, trapped on aerosol filters in different villages of Belarus after the Chernobyl accident, have been investigated by autoradiographic, gamma-spectrometric and radiochemical analysis to estimate dimensions of the particle, their structure, radionucleide composition and origin.

10826 (JINR-E–3-93-61, pp. 152-156) **Radon levels in dwellings of Ukraine.** Zelensky, A.V. (and others). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 205p. (CONF-9203318–: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. International Workshop Solid State Nuclear Track Detectors and their Applications.* Order Number DE95620429. Source: OSTI; NTIS (US Sales Only); INIS.

The results of about 1500 measurements of Rn-222 levels in houses on the territory of Ukraine are reported.

10827 (JINR-E–3-93-61, pp. 157-162) **SSNTD-technique for radon measurements indoors and in the soil in Sweden.** Jonsson, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 205p. (CONF-9203318–: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. International Workshop Solid State Nuclear Track Detectors and their Applications.* Order Number DE95620429. Source: OSTI; NTIS (US Sales Only); INIS.

The use of SSNTD-technique and Kodak LR 115-II plastic films in radon detection from technical point of veiw is discussed.

10828 (Juel–2938) **A supplement for the RADM2 chemical mechanism: The photooxidation of isoprene.** Zimmermann, J.; Poppe, D. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie und Dynamik der Geosphaere 3: Atmosphaerische Chemie. Jul 1994. 57p. Order Number DE95752745. Source: OSTI; NTIS (US Sales Only).

The RADM2 chemical mechanism is a scheme for the tropospheric gas phase chemistry for the use in chemistry and transport models. During recent years the importance of isoprene as a reactive biogenic hydrocarbon has been recognized. Since isoprene is poorly represented in RADM2 we have developed an extension by a comprehensive isoprene chemistry. This detailed mechanism (RADM-E) leads to the same results as RADM2 for vanishing concentration of isoprene. The main consequences are the enhanced production of organic nitrates in the course of the isoprene oxidation and the improved conservation of carbon compounds in RADM-E. The balanced C-budget brings about higher concentrations of peroxy radicals and organic peroxides. The formation of organic nitrates leads to smaller amounts of other reactive N-compounds, affecting directly NO_x, HNO_3, and PAN, and indirectly HO_x, H_2O_2, and O_3. Since RADM-E includes 34 new species and 112 additional reactions it is not suitable for use in three dimensional transport and chemistry calculation. Therefore a condensed version (RADM-C) was developed with only 8 new species and 19 additional reactions. RADM-C gives approximately the same results as RADM-E, if $[NO_x] > 0.1$ ppb. RADM-E is also compared with the chemical mechanism of Lurmann et al. (1986), which is widely used and includes the chemistry of isoprene in a different manner. In four scenarios, covering typical situations with high impact of isoprene, the chemical mechanisms RADM2 and RADM-C are compared, utilizing a simple 2-box-model. Differences of concentrations can exceed 10% for O_3 and a factor of 2 for HO_x, peroxides, NO_x, PAN, and HNO_3. Carbonyl compounds show even higher differences. (orig.)

10829 (Juel–2946) **Investigations of adsorption and desorption ob mercury and mercury(II)chloride on rhenish lignite coke.** Thevessen, R. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Technische Hochschule Aachen (Germany). Jul 1994. 94p. (In German). Order Number DE95745907. Source: OSTI; NTIS (US Sales Only).

Activated coke from rhenish lignite coal is reasonably priced adsorption material for the purification of flue gas from a waste incineration plant. This study examines the adsorption and desorption behaviour of mercury (Hg) and mercury(II)chloride ($HgCl_2$) on coke. For that purpose coke samples were loaded with Hg and ($HgCl_2$) in a laboratory facility. Additional to untreated coke, sulphuric acid impregnated coke was used too. The examinations of desorption were conveyed through thermal analysis and mass spectrometry. The adsorption quality of the coke for mercury species is strongly increased by impregnation with sulphuric acid. The desorption of Hg begins at 150 C. Heating up to 500 C under inert gas conditions is a simple method for entire desorption. (orig.)

10830 (Juel–2951) **A comparison of measured OH concentrations with model calculations.** Poppe, D.; Zimmermann, J.; Bauer, R.; Brauers, T.; Bruening, D.; Callies, J.; Dorn, H.P.; Hofzumahaus, A.; Johnen, F.J.; Khedim, A.; Koch, H.; Koppmann, R.; London, H.; Mueller, K.P.; Neuroth, R.; Plass-Duelmer, C.; Platt, U.; Rohrer, F.; Roeth, E.P.; RudoForschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie und Dynamik der Geosphaere 3: Atmosphaerische Chemie. Aug 1994. 50p. Order Number DE95752934. Source: OSTI; NTIS (US Sales Only).

The influence of chemical precursors and sunlight on the atmospheric OH abundance is investigated by a comparison of locally measured tropospheric OH concentration with model calculations. The latter are based on the gas phase reaction mechanism of the Regional Acid Deposition Model (RADM2) which incorporates an explicit inorganic and a comprehensive organic chemistry. The experimental data were obtained in the planetary boundary layer during two sets of campaigns. In Deuselbach (1983) and Schauinsland (1984) rural conditions were encountered with NO_x concentrations on the average of 2.2 ppb and 0.9 ppb, respectively. This data set was already compared with model calculations based upon an older and less detailed chemical reaction scheme (Perner et al., 1987). Since then the experimental data were reanalysed leading to modified measured OH concentrations and also to modified precursor concentrations. For a consistent comparison with the more recent campaigns in Juelich (1987 and 1988) we have redone the calculations. The modeled and measured OH-concentrations of the campaigns in 1983 and 1984 correlate well with a coefficient of correlation of $r = 0.73$. The model overpredicts OH by about 20%. Under more polluted conditions in Juelich with average NO_x concentrations of 4 ppb the correlation coefficient between experimental and modeled data are significantly smaller ($r = 0.61$). Possible reasons are the influence of not measured precursors, for example isoprene, and the inapplicability of a quasi steady state model under the spatially inhomogeneous conditions in Juelich. Again the model overpredicts the OH concentration by about 15%, which is somewhat smaller than for the rural case. The precision of the comparison is limited by the uncertainties of the chemical reaction rate constants. (orig.)

10831 (K/D–5696) **A computer program for superpositioning multiple UF_6 plume simulations to determine health effects.** Holt, D.D. Oak Ridge National Lab., TN (United States). Mar 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE95006361. Source: OSTI; NTIS; GPO Dep.

The MERGE program is a post-processor for the UF_6 atmospheric dispersion program (ADP). It superimposes the results from several plume simulations and determines for given ground level locations on a grid the total dose and health effect of specified components. The MERGE program utilizes a Gaussian dispersion model's results, an assumed Gaussian profile, and an approximation for transient behavior.

10832 (KFK–5338) **Karlsruhe Nuclear Research Center, Laboratory for Aerosol Physics and Filter Technology. Progress report on research and development work in 1993.** Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik (LAF). Mar 1994. 21p. (In German). Order Number DE95746570. Source: OSTI; NTIS (US Sales Only).

Activities at the Laboratory for Aerosolphysics and Filter Technology are dedicated to the development of methods for separation of fine dusts and noxious gases from industrial plants, to investigations into the aerosolphysics and aerosolchemistry of the atmosphere, and to studies of special problems of the release of pollutants from nuclear facilities. (orig.)

10833 (LA-SUB–95-6) **Summary of studies conducted under LANL subcontracts: 9-X73-4229J-1 and 9-XC3-9739K-1.** Ortiz, C.A.; Chandra, S.; Fan, B.; Muyshondt, A.; Parulian, A.; McFarland, A.R. Los Alamos National Lab., NM (United States). Oct 1994. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006696. Source: OSTI; NTIS; GPO Dep.

Under the scope of the ventilation stack study, 1/3 scale models of the TA-55 facility FE- 15 and FE-16 stacks were fabricated and tested. Tests were conducted to achieve stack and plenum configurations that would produce adequate mixing, flow uniformity and particulate concentration uniformity. This should enable effective single point sampling in these exhaust stacks at the existing sampling locations during normal and emergency operating conditions. Velocity profiles were obtained at the current sampling location. Flow mixing was evaluated via a tracer gas technique. Gas concentration profiles were measured with the help of the tracer gas technique while releasing the tracer gas in the different inlet ducts. Finally, aerosol particle concentration profiles were measured at the existing sampling locations. The results indicated that the present field configurations of the two stacks produced poor mixing. Adjustments and modifications of the model configurations were carried out to arrive at uniform velocity, gas and aerosol particle concentrations profiles at the present sampling location. The modified models typically produced profile coefficients of variations that were less than 10%, suggesting that the present sampling locations could effectively be used for single-point sampling. The filter air sampler research is concerned with the development of a

filter air sampler to ease filter changing efficiency and to provide a built in flow indicator. Testing was done on the new sampler to find the effect on the entrance efficiency by variations in the parameter-air speed, particle size, flow rate, and orientations. It was found that the aerosol sampling efficiencies of the new unit are no different from the filter air sampler currently used by Los Alamos National Laboratory.

10834 (LA-UR–95-172) **Home radon monitor modeled after the common smoke detector.** Bolton, R.D.; Arnone, G.J.; Johnson, J.P. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950216–38: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006299. Source: OSTI; NTIS; GPO Dep.

The EPA has declared that five million or so of the nation's 80 million homes may have indoor radon levels that pose an unacceptably high risk of lung cancer to occupants. They estimate that four times as many people die from radon-induced lung cancers as from fires in the home. Therefore the EPA has recommended that all homes be tested and that action be taken to reduce the radon concentration in homes that test above the 4 pCi/L level. The push to have homeowners voluntarily test for elevated radon levels has been only marginally successful. A reliable, inexpensive, and accurate in-home radon monitor designed along the same general lines as a home smoke detector might overcome much of the public reluctance to test homes for radon. Such a Home Radon Monitor (HRM) is under development at Los Alamos National Laboratory. To be acceptable to the public, HRMs should have the following characteristics in common with smoke detectors: low cost, small size, ease of installation and use, low maintenance, and high performance. Recent advances in Long-Range Alpha Detection technology are being used in the design of a HRM that should meet or exceed all these characteristics. A proof-of-principle HRM detector prototype has been constructed and results from tests of this prototype will be presented.

10835 (NEI-DK–1862) **Environmental stresses caused by the transportation sector.** Trafikministeriet, Copenhagen (Denmark). Oct 1994. 88p. (In Danish). Order Number DE95755097. Source: OSTI; NTIS.

An account is given of calculations on energy consumption within the Danish transportation sector, and of carbon dioxide emission and air pollution from this source. The results of these calculations show that the 1990 goals for air pollution abatement related to the transportation sector cannot be achieved unless special action is taken. This is significantly the case with respect to carbon dioxide emission. The aim of the report is thus to describe possible methods for the reduction of CO_2 emission from vehicles etc. One of the methods is the use of taxation. The increase in the need for the transport of persons during the period 1988-2010 is reckoned and the influence of economic growth is discussed. (AB)

10836 (ORNL/TM–12817, pp. 409) **Automated radioactive control system of the Moscow Meson Factory's releases.** Serezhnikov, S.V. (Institute for Nuclear Research of the Russian Academy of Sciences, Moscow (Russian Federation)); Stepanov, V.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

We have been investigating the radiation environmental effects from high current proton accelerators. Now we are creating an Automatic Radioactive Control System of the Moscow meson factory's releases (ARCS) into the atmosphere. The composition of the releases consists primarily of the short-lived radioactive gases C, N, O, O. About 10% of the releases consist of Ar and about 2% are other radionuclides. The continual sampling of the released mixture results from the pressure difference existing in the ventilation system. The mixture sampling network includes the filters, the ionization and the measuring chambers, where gamma-rays with energy of 0.511 Mev and 1.29 Mev are measured with the scintillation gamma spectrometer. Additionally, the system measures gross gamma and beta activity, the speed of the selected mixture, the speed of the released mixture, the speed and direction of the wind, the vertical gradient of the temperature and the humidity of the released mixture. The results of the measurements needed for sight and population dose model calculations are written into a database of ARCS.

10837 (ORNL/TM–12817, pp. 413-419) **Microclimatic effects on outdoor radon and its progeny in a long-term study.** Schuetz, M. (Univ. of Saarland, Homburg (Germany)); Keller, G.; Kappel, R.J.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The dose due to the long term radon exposure is estimated from the radon concentration and from an equilibrium factor that in the literature is reported with a wide uncertainty. Therefore the radon equilibrium factor outdoors and its dependence on climatic effects should be investigated in a long-term study. Both the outdoor concentrations of radon and of its progeny near Ellweiler/Hunsrueck were measured continuously during 12 months and the resulting equilibrium factors were determined. Simultaneously to the every 2 hour's radon data many meterological parameters as temperature and relative to humidity of the air, barometric pressure and duration and amount of rainfall were recorded. At a height of 6 meters above ground and in 10 minute intervals the local wind direction and velocity were registered. By that a set of more than 3000 single measurements of the equilibrium factor and of the corresponding weather conditions was collected.

10838 (ORNL/TM–12817, pp. 421) **Intercalibration of various types of passive radon dosimeters employing particle track detectors.** Qureshi, A.A. (Radiation Physics Division, Nilore (Pakistan)); Jamil, K.; Fazal-ur-Rehman; Khan, H.A.; Al-Ahmady, D. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the intercalibration of various dosimeters, devised to measure radon concentration using particle track detectors. The present work includes Box-type, Cup-type, Tube-type, Bare-type, and Circular-type dosimeters using CR-39 and CN-85 particle track detectors. Experiments have been carried out in a custom designed exposure chamber connected to a radon source. The calibration results, determined in terms of Bq/m^3 with respect to Box-type dosimeter, are useful for intercomparison and standardization of measured radon concentrations by various types of passive radon dosimeters in various laboratories.

10839 (RISO-R–787(EN)) **Traffic PAH and other air pollutant in the center of a large city.** Nielsen, T. (Risoe National Lab., Roskilde (Denmark)); Joergensen, H.E.; Grundahl, L.; Bang Jensen, A.; Aagaard Nielsen, P.; Toennesen, J. Risoe National Lab., Roskilde (Denmark). Environmental Science and Technology Dept. Feb 1995. 72p. Order Number DE95755114. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The presence of particulate PAH and mutagens and other air pollutants (soot, particles, CO, NMHC, NO, gas NO_y, particulate metals, sulphate, chloride and bromide) was investigated in a busy street (60,000 vehicles each day) in Central Copenhagen and in a park area adjacent to the street in the period January - March. The concentrations of benzo(a)pyrene and benzo(e)pyrene (BeP) were 4.4 ± 1.2 and 4.4 ± 0.7 ng/m^3, respectively, in the busy street and 1.4 ± 0.6 and 1.3 ± 0.3 ng/m^3, respectively, in the park area. Applying BeP as PAH indicator the traffic contribution was estimated to be 80% in the street. The weekdays distribution was as follows: Working days: 90%. Weekends: 60%. In the city park area the working days traffic contribution was estimated to be 40%. The simple chemical mass balance method performed to do these estimates applying the ratio between benzo(ghi)perylene and BeP and that between coronene and BeP was demonstrated as a control to give a satisfactor description of the PAH contribution from traffic

sources and from other sources in different cases: A city traffic PAH profile was determined. The busy street PAH profile was very close to the city traffic one. The diurnal variation of PAH showed peaks in the morning and afternoon rush hours and the lowest concentrations in the night hours and was very close to the diurnal variation of the traffic gases, CO, NO and gas NO_y. A method to differentiate between PAH contribution from petrol vehicles and those from diesel vehicles was developed and applied. It is concluded the PAH contributions from petrol vehicles and from diesel vehicles are comparable. (au) (13 tabs., 20 ills., 74 refs.)

10840 (RVF-R–95-1) **Environmental consequences of nitrogen oxide-, ammonia-, and nitrous oxide emission.** Iverfeldt, Aa. (Institutet foer Vatten- och Luftvaardsforskning, Stockholm (Sweden)); Pleijel, H.; Klemedtson, L.; Loevblad, G.; Omstedt, G. Svenska Renhaallningsverksfoereningen, Malmoe (Sweden). Jan 1995. 34p. (In Swedish). Order Number DE95744962. Source: OSTI; NTIS.

The aim of the present study has been to compare the environmental problems that are connected to nitrogenous pollutants from energy production when firing biofuels. Three alternatives for reduction of nitrogen oxides with ammonia or urea have been studied. 21 refs, 9 figs, 8 tabs

10841 (SA-PUB–1/94, pp. 31-36) **Climatic changes in Northern Europe.** Heino, R. (Finnish Meteorological Inst., Helsinki (Finland)); Tuomenvirta, H. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The creation of reliable, multi-element, long-term climate data base of Finland facilitates many types of climatological studies. Besides, these data sets (national and NACD) are expected to have wide use also outside this project. The temperature time series can be used in the calibration of dendrochronological series. The climate scenarios need common baseline and the so-called 'weather generators' require statistical parameters from real observations. The verification of climate models is hindered by the shortness of suitable time series for the forcing and testing of the models. It is hoped that the NACD can alleviate the problem. The data phase of the NACD was done nationally under the common, agreed guidelines. Similarly, the detailed analysis of the variability of the Finnish climate has been done in Finland. After the whole NACD data base is organised, much more change of ideas and results is expected and needed. The realisation of some of the objectives is related to progress in other member countries.

10842 (SA-PUB–1/94, pp. 45-51) **Climate models and scenarios.** Fortelius, C. (Helsinki Univ. (Finland). Dept. of Meteorology); Holopainen, E.; Kaurola, J.; Ruosteenoja, K.; Raeisaenen, J. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

In this project, climate simulation results for northern Europe have been compared with observations and with each other. The main emphasis has been on a few key quantities describing the seasonal mean climate. The comparison of results for 'control climate' with observational data revealed that, for example, the simulated winter temperatures are usually too cold in northern Europe. In Finland, this bias is almost 15 deg C in some models, but some simulations give fairly realistic temperatures. In summer, the simulated temperatures also tend to be too cold in Finland, but the errors are much smaller than in winter. In the IPCC data base, precipitation data are unfortunately available for only three models. At most locations in northern Europe, the simulated precipitation is in all of these models too small in summer, but it exceeds the measured values in winter. In northern Europe, the available experiments generally indicate a larger warming due to increased CO_2 in winter than in summer. For those four experiments in which CO_2 was increased gradually and results at the time of its doubling are available, the average warming in Finland is 3-4 deg C in winter and slightly over 2 deg C in summer. However, the difference between winter and summer is somewhat smaller in those two models which succeeded best in comparison with observations. In the light of the available results, a slight increase of annual precipitation (5-15 % at the doubling of CO_2) seems probable in Finland as well as in most other parts of northern Europe. Due to the differences between the individual experiments, not much can be said about the seasonal and geographical variations of this increase.

10843 (SA-PUB–1/94, pp. 52-58) **Microclimatic models, estimation of solar radiation and evaporation over land surfaces.** Heikinheimo, M. (Finnish Meteorological Inst., Helsinki (Finland). Climatology Div.); Venaelaeinen, A.; Tourula, T. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

A summary of the parameterization and comparison of modelled and measured results on evapotranspiration over two contrasting seasons are presented. Studies on other types of land surface, i.e. over forests and lakes are in progress. An intensive field campaign, NOPEX (Northern Hemisphere Climate Processes Experiment), will be carried out in Sweden, Uppland region, during summers 1994 and 1995. Our objective in this multidisciplinary field experiment is to quantify the contribution of lakes on exchange of heat energy and water vapour in the regional scale.

SILMU Research Programme.

Modelling and experimental measurements of this study are consistent with the assumption that sulfate, both athropogenic and biogenic, can have climatic effects. However, our knowledge of the sulfate origin and behavior in the atmosphere is still limited. There are only rare direct measurements of aerosol scattering properties in the European subarctic/arctic continent. Also missing is adequate data to assess the contribution of sulfate and other hygroscopic aerosols on visibility and albedo through fog and clouds in the northern Europe. Simultaneous experimental studies are needed in future for atmospheric chemistry of inorganic ion species in aerosol form and for relevant climate change parameters like aerosol back-scattering/light absorption and hygroscopic growth.

10845 (SA-PUB–1/94, pp. 73-78) **The behaviour of stratospheric and upper tropospheric ozone in high latitudes.** Kyroe, E. (Finnish Meteorological Inst., Sodankylae (Finland). Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

During the recent years the emphasis of the atmospheric ozone research has moved from the Antarctica to the Arctic. In the northern hemisphere areas within and close to the polar region are much more densely populated than the corresponding regions in the southern hemisphere. Finland is one of the affected countries and studying atmospheric ozone, its evolution and the consequences, has therefore been accepted as one of the research priorities in SILMU. For the future, the need for global modelling expertise is obvious. This applies equally well in considering the available global satellite data, as well as ground-based measurement. We are currently participating in a project to develop a three-dimensional chemical modelling tool for the global stratosphere. This work is done in cooperation with the University of Oslo. The first phase of the project, the add-on of a consistent stratospheric chemistry scheme to a chemical transport model (CTM) has already been completed. The model update is expected to be ready by the end of the SILMU. As a result, the vertical resolution of the CTM will be improved and it can use contemporary meteorological data from the ECMWF to drive the chemical evolution of the model atmosphere. Modelling will also permit us to simulate the impacts of the proposed changes in the global and regional climate.

10846 (SA-PUB–1/94, pp. 85-90) **Tropospheric chemistry of greenhouse gases in Finnish conditions.** Laurila, T. (Finnish Meteorological Inst., Helsinki (Finland). Air Quality Dept.); Hakola, H.; Joffre, S.M.; Laettilae, H.; Koskinen, T. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

In Finland, enhanced ozone concentrations are observed from March to September. One of the aims of this project is to study concentrations of ozone and its precursors in clean and polluted air masses in various parts of Finland. The concentrations of non-methane hydrocarbons (NMHC) whose photochemical lifetimes range from hours to months have been studied. These species are important precursors of ozone and their relative abundances can be used to indicate their sources, which are both anthropogenic and natural. In addition, they are a source of atmospheric carbon. Another research topic is the ozone levels in Finland in polluted and clean air masses and their eventual trends. The in-situ photochemical production of ozone and its relation to the precursor species is studied directly from observations and by modelling studies.

10847 (SA-PUB–1/94, pp. 375-380) **Assessment of the impact of the greenhouse gas emission and sink scenarios in Finland on radiative forcing and greenhouse effect.** Pipatti, R. (Technical Research Centre of Finland, Espoo (Finland)); Savolainen, I.; Sinisalo, J. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The objective of this work is to study greenhouse gas emissions and sinks and their greenhouse impact as a function of time. The greenhouse impact is expressed in terms of radiative forcing which measures the perturbation in the Earth's radiation budget. Radiative forcing is calculated on the basis of the concentration changes of the greenhouse gases and the radiation absorption properties of the gases. It takes into account the relatively slow changes in the concentrations due to natural removal and transformation processes and also allows a comparison of the impact of various greenhouse gases and their possible control options as a function of time.

10848 (UCRL-ID–114037) **The northern wintertime divergence extrema at 200 hPa and surface cyclones as simulated in the AMIP integration of the ECMWF general circulation model.** Boyle, J.S. Lawrence Livermore National Lab., CA (United States). Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95007946. Source: OSTI; NTIS; GPO Dep.

Divergence and convergence centers at 200 hPa and mean sea level pressure (MSLP) cyclones were located every 6 hr for a 10-yr general circulation model (GCM) simulation with the ECMWF (Cycle 36) for the boreal winters from 1980 to 1988. The simulation used the observed monthly mean sea surface temperature (SST) for the decade. Analysis of the frequency, location, and strength of these centers and cyclones gives insight into the dynamical response of the model to the varying SST. The results indicate that (1) the model produces reasonable climatologies of upper-level divergence and MSLP cyclones; (2) the model distribution of anomalies of divergence and convergence centers and MSLP cyclones is consistent with observations for the 1982-83 and 1986-87 El Nifio events; (3) the tropical Indian Ocean is the region of greatest divergence activity and interannual variability in the model; (4) the variability of the divergence centers is greater than that of the convergence centers; (5) strong divergence centers occur chiefly over the ocean in the midlatitudes but are more land-based in the tropics, except in the Indian Ocean; and (6) locations of divergence and convergence centers can be a useful tool for the intercomparison of global atmospheric simulations.

10849 (UCRL-ID–118434) **Coupled chemistry/climate issues.** Rotman, D.A. (Lawrence Livermore National Lab., CA (United States). Global Climate Research Div.); Wuebbles, D.J. Lawrence Livermore National Lab., CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006443. Source: OSTI; NTIS; GPO Dep.

Driven by both natural and anthropogenic causes, the distributions of trace chemical species in the atmosphere has altered the natural state of the chemical distribution and, the authors believe, the climate system. A clear example of this change and its effect on climate is through tropospheric ozone. Evidence shows that over the last decade tropospheric ozone has increased, probably caused by increasing concentrations and emissions of CH_4, CO, NO_x, and NMHCs (nonmethane hydrocarbons). Tropospheric ozone is photochemically produced when nitrogen oxides react in the presence of carbon monoxide, methane, non-methane hydrocarbons and sunlight. The chemistry of ozone and NO_x is also closely associated with the hydroxyl radical (OH), which governs the atmospheric lifetime of a number of species, including CH_4 and chlorofluorocarbons (CFCs), which are major greenhouse gases and which affect the chemical balance of the stratosphere. Increases in the concentrations of CO and CH_4 can lead to decreased concentrations of OH and a positive feedback on the atmospheric lifetimes of CO and methane. The same would occur for other greenhouse gases and for some of the important reactions which form aerosols in the troposphere. This would further enhance the concentrations of the gases and accelerate the radiative effects from these greenhouse species, strongly affecting climate and the accurate prediction of climate. It is believed that warmer climates will also increase the amount of water in the atmosphere, thereby providing another chemistry feedback on OH.

10850 (UCRL-JC–116574) **Impacts of microphysics, radiation and environmental winds in mid-latitude and tropical squall-line systems, and their climatic implications.** Chin, Hung-Neng. Lawrence Livermore National Lab., CA (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950124–4: 75. annual meeting of the American Meteorological Society: diamond anniversary, Dallas, TX (United States), 15-20 Jan 1995). Order Number DE95004965. Source: OSTI; NTIS; INIS; GPO Dep.

Cloud-radiation feedback has been identified as the most important factor limiting general circulation models (GCMS) to further progress in climate change research (Cess et al., 1989). It is also regarded as a major uncertainty in estimating the impact of greenhouse gases on climate simulations. As a result, many GCMs showed high sensitivity to the treatment of clouds and cloud radiative properties. Therefore, a better understanding of cloud-radiation feedback on the large-scale environment is absolutely essential to improve the representation of cloud processes in GCMS. To this end, a cloud model with enhanced model physics is used to study the impact of cloud-radiation interactions on mesoscale convective systems (MCSs). Case studies representing a variety of convective systems are important to generalize the overall effects of anvil clouds on the large-scale environment. Our primary interesting is limited to the MCSs in an environment with substantial wind shear, such as squall-line systems, because they have longer lifetime and wider coverage to impact the earth radiation budget and climate. The objective of this study is to investigate the impacts of microphysics, radiation and environmental winds on mid-latitude continental and tropical oceanic squall-line systems. Comparisons between these two systems are presented. Recent studies indicated that the vertical shear of the environmental wind plays an important role in the formation of the anvil cloud through the tilting of MCSS. However, this process has not been represented in GCMS. A detailed investigation on the formation of anvil clouds and their relationship to cumulus portions of MCSs would help develop a better cloud parameterization for use in GCMS. Two important issues are addressed through these comparisons. First, what factors cause the differences between mid-latitude and tropical anvil clouds? Second, do these differences have climatic implications to improve our climate forecasting ability?

10851 (UCRL-JC–118555) **Issues relevant to the development of coupled chemistry/climate models.** Penner, J.E. (Lawrence Livermore National Lab., CA (United States)); Austin, J.; Cariolle, D.; Kelder, H.; Kylling, A.; Prather, M.J.; Steil, B. Lawrence Livermore National Lab., CA (United States). Sep 1994. 19p. Sponsored by USDOE, Washington, DC (United

States);National Aeronautics and Space Administration, Washington, DC (United States);Deutsche Forschungsgemeinschaft, Bonn (Germany);Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Norges Almenv DOE Contract W-7405-ENG-48. (CONF-9406301–1: North American Treaty Organization (NATO) advanced research workshop on atmospheric ozone as a climate gas, Lillehammer (Norway), 19-23 Jun 1994). Order Number DE95006441. Source: OSTI; NTIS; GPO Dep.

Our belief that climate will inexorably change is driven by the very clear evidence of chemical abundance changes in the atmosphere during the last four decades. In the past, this belief has led to the development of two separate efforts: to understand and build models to describing the physical climate system and to understand and build models of the chemical climate system. But how will these two systems interact? Are there important chemical changes that result from climate change that need to be understood and properly accounted for in order to predict the evolution of the climate system? Are there important climate changes that may affect chemical abundances that must be addressed? Large strides have been made in our capability to predict both the physical climate system and the chemical climate system during the past few years. In spite of extant uncertainties in both General Circulation Models (GCMs) and Chemical Transport Models (CTMs), we should begin the process of understanding how and to what extent these errors might propagate in the coupled system. We have outlined a strategy for quantifying the effective uncertainties and have defined a few initial steps in the process. Systematic study of the importance of uncertainties and their impact in the coupled system is a prerequisite to progress in coupling the chemical and climate systems. Such coupling is necessary if we are to predict the evolution of climate in the future.

10852 (UCRL-JC–118866) **Carbonaceous aerosols influencing atmospheric radiation: Black and organic carbon.** Penner, J.E. (Lawrence Livermore National Lab., CA (United States). Global Climate Research Div.). Lawrence Livermore National Lab., CA (United States). Sep 1994. 35p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404123–2: Dahlem workshop, Berlin (Germany), 24 Apr 1994). Order Number DE95006437. Source: OSTI; NTIS; GPO Dep.

Carbonaceous particles in the atmosphere may both scatter and absorb solar radiation. The fraction associated with the absorbing component is generally referred to as black carbon (BC) and is mainly produced from incomplete combustion processes. The fraction associated with condensed organic compounds is generally referred to as organic carbon (OC) or organic matter and is mainly scattering. Absorption of solar radiation by carbonaceous aerosols may heat the atmosphere, thereby altering the vertical temperature profile, while scattering of solar radiation may lead to a net cooling of the atmosphere/ocean system. Carbonaceous aerosols may also enhance the concentrations of cloud condensation nuclei. This paper summarizes observed concentrations of aerosols in remote continental and marine locations and provides estimates for the fine particle ($D < 2.5\ \mu m$) source rates of both OC and BC. The source rates for anthropogenic organic aerosols may be as large as the source rates for anthropogenic sulfate aerosols, suggesting a similar magnitude of direct forcing of climate. The role of BC in decreasing the amount of reflected solar radiation by OC and sulfates is discussed. The total estimated forcing depends on the source estimates for organic and black carbon aerosols which are highly uncertain. The role of organic aerosols acting as cloud condensation nuclei (CCN) is also described.

10853 (UCRL-JC–119457) **A parallel coupled oceanic-atmospheric general circulation model.** Wehner, M.F.; Bourgeois, A.J.; Eltgroth, P.G.; Duffy, P.B.; Dannevik, W.P. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411178–1: 6. workshop on use of parallel processors in meterology, Reading (United Kingdom), 24 Nov 1994). Order Number DE95005918. Source: OSTI; NTIS; GPO Dep.

The Climate Systems Modeling group at LLNL has developed a portable coupled oceanic-atmospheric general circulation model suitable for use on a variety of massively parallel (MPP) computers of the multiple instruction, multiple data (MIMD) class. The model is composed of parallel versions of the UCLA atmospheric general circulation model, the GFDL modular ocean model (MOM) and a dynamic sea ice model based on the Hiber formulation extracted from the OPYC ocean model. The strategy to achieve parallelism is twofold. One level of parallelism is accomplished by applying two dimensional domain decomposition techniques to each of the three constituent submodels. A second level of parallelism is attained by a concurrent execution of AGCM and OGCM/sea ice components on separate sets of processors. For this functional decomposition scheme, a flux coupling module has been written to calculate the heat, moisture and momentum fluxes independent of either the AGCM or the OGCM modules. The flux coupler's other roles are to facilitate the transfer of data between subsystem components and processors via message passing techniques and to interpolate and aggregate between the possibly incommensurate meshes.

10855 (ANL/ES/CP–84872) **Chelant extraction and REDOX manipulation for mobilization of heavy metals from contaminated soils.** Brewster, M.D.; Peters, R.W.; Miller, G.A.; Patton, T.L.; Martino, L.E. Argonne National Lab., IL (United States). [1994]. 12p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941245–1: IGT symposium on gas, oil, and environmental biotechnology, Colorado Springs, CO (United States), 12-14 Dec 1994). Order Number DE95004131. Source: OSTI; NTIS; INIS; GPO Dep.

Was the result of open burning and open detonation of chemical agents and munitions in the Toxic Burning Pits area at J-Field, located in the Edgewood Area of Aberdeen Proving Ground in Harford County, Maryland, soils have been contaminated with heavy metals. Simultaneous extraction is complicated because of the multitude of contaminant forms that exist. This paper uses data from a treatability study performed at Argonne National Laboratory to discuss and compare several treatment methods that were evaluated for remediating metals-contaminated soils. J-Field soils were subjected to a series of treatability experiments designed to determine the feasibility of using soil washing/soil flushing, enhancements to soil washing/soil flushing, solidification/stabilization, and electrokinetics for remediating soils contaminated with metals. Chelating and mobilizing agents evaluated included ammonium acetate, ethylenediaminetetraacetic acid, citric acid, Citranox, gluconic acid, phosphoric acid, oxalic acid, and nitrilotriacetic acid, in addition to pH-adjusted water. REDOX manipulation can maximize solubilities, increase desorption, and promote removal of heavy metal contaminants. Reducing agents that were studied included sodium

borohydride, sodium metabisulfite, and thiourea dioxide. The oxidants studied included hydrogen peroxide, sodium percarbonate, sodium hypochlorite, and potassium permanganate. This paper summaries the results from the physical/chemical characterization, soil washing/soil flushing, and enhancements to soil washing/soil flushing portions of the study.

10856 (CONF-9405183–2) **Poster session ELIPGRID-PC.** Davidson, J.R. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. national technical information exchange workshop; Kennewick, WA (United States); 10-12 May 1994. Order Number DE95006744. Source: OSTI; NTIS; INIS; GPO Dep.

ELIPGRID-PC, a new personal computer program, has been developed to provide easy access to Singer's ELIPGRID algorithm for hot-spot detection probabilities. Three features of the program are the ability to determine: (1) the grid size required for specified conditions, (2) the smallest hot spot that can be sampled with a given probability, and (3) the approximate grid size resulting from specified conditions and sampling cost. ELIPGRID-PC also provides probability of detection versus cost data for graphing with spreadsheets or graphics software. The program has been successfully tested using Singer's published ELIPGRID results. An apparent error in the published ELIPGRID code has been uncovered and an appropriate modification incorporated into the new program.

10857 (CONF-940983–5) **Passive field monitoring of plutonium and americium in soil.** Gammage, R.B. (Oak Ridge National Lab., TN (United States). Health Sciences Research Div.); Meyer, K.E.; Dudney, C.S. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international symposium and exhibition on environmental contamination in Central and Eastern Europe; Budapest (Hungary); 20-23 Sep 1994. Order Number DE95006739. Source: OSTI; NTIS; INIS; GPO Dep.

The authors' progress is described in applying passive alpha track detectors (ATDS) and electret ion chambers (EICS) to in-situ field monitoring of soils contaminated with particulate plutonium and americium at a desert site. By varying the exposure times, from a few minutes to about one day, they quantitatively measured alpha activity varying between ~ 100 pCi/g and ~ 100 nCi/g. Suggested applications are definition of the boundaries of contamination zones and verification that post-remediated soils are below release limits.

10858 (CONF-9409285–1) **3-D subsurface modeling within the framework of an environmental restoration information system: Prototype results using earthvision.** Goeltz, R.T.; Zondlo, T.F. Oak Ridge National Lab., TN (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Federal geographic technology '94; Washington, DC (United States); 27 Sep 1994. Order Number DE95005389. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the DOE Oak Ridge Reservation (DOE-ORR) placement on the EPA Superfund National Priorities List in December of 1989, all remedial activities, including characterization, remedial alternatives selection, and implementation of remedial measures, must meet the combined requirements of RCRA, CERCLA, and NEPA. The Environmental Restoration Program, therefore, was established with the mission of eliminating or reducing to prescribed safe levels the risks to the environment or to human health and safety posed by inactive and surplus DOE-ORR managed sites and facilities that have been contaminated by radioactive and surplus DOE-ORR managed sites and facilities that have been contaminated by radioactive, hazardous, or mixed wastes. In accordance with an established Federal Facilities Agreement (FFA), waste sites and facilities across the DOE-ORR have been inventoried, prioritized, and are being systematically investigated and remediated under the direction of Environmental Restoration. EarthVision, a product of Dynamic Graphics, Inc., that provides three-dimensional (3-D) modeling and visualization, was exercised within the framework of an environmental restoration (ER) decision support system. The goal of the prototype was to investigate framework integration issues including compatibility and value to decision making. This paper describes the ER program, study site, and information system framework; selected EarthVision results are shown and discussed. EarthVision proved effective in integrating complex data from disparate sources and in providing 3-D visualizations of the spatial relationships of the data, including contaminant plumes. Work is under way to expand the analysis to the full site, covering about 1600 acres, and to include data from new sources, particularly remote-sensing studies.

10859 (DOE/ER/61199–T1) **Stochastic modeling of macrodispersion in unsaturated heterogeneous porous media. Final report.** Yeh, T.C.J. Arizona Univ., Tucson, AZ (United States). Dept. of Hydrology and Water Resources. [1995]. 418p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61199. Order Number DE95006398. Source: OSTI; NTIS; GPO Dep.

Spatial heterogeneity of geologic media leads to uncertainty in predicting both flow and transport in the vadose zone. In this work an efficient and flexible, combined analytical-numerical Monte Carlo approach is developed for the analysis of steady-state flow and transient transport processes in highly heterogeneous, variably saturated porous media. The approach is also used for the investigation of the validity of linear, first order analytical stochastic models. With the Monte Carlo analysis accurate estimates of the ensemble conductivity, head, velocity, and concentration mean and covariance are obtained; the statistical moments describing displacement of solute plumes, solute breakthrough at a compliance surface, and time of first exceedance of a given solute flux level are analyzed; and the cumulative probability density functions for solute flux across a compliance surface are investigated. The results of the Monte Carlo analysis show that for very heterogeneous flow fields, and particularly in anisotropic soils, the linearized, analytical predictions of soil water tension and soil moisture flux become erroneous. Analytical, linearized Lagrangian transport models also overestimate both the longitudinal and the transverse spreading of the mean solute plume in very heterogeneous soils and in dry soils. A combined analytical-numerical conditional simulation algorithm is also developed to estimate the impact of in-situ soil hydraulic measurements on reducing the uncertainty of concentration and solute flux predictions.

10860 (DOE/ER/61200–3) **Transport of subsurface bacteria in porous media.** Bales, R.C.; Arnold, R.G.; Gerba, C.P. Arizona Univ., Tucson, AZ (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61200. Order Number DE95006419. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study was to develop tools with which to measure the advective transport of microorganisms through porous media. These tools were then applied to investigate the sorptive properties of representative microorganisms that were selected at random from the DOE's deep subsurface collection of bacterial, maintained at Florida State University. The transport screening procedure that arose from this study was also used to investigate biological factors that affect the transport/sorption of biocolloids during their movement through porous media with the bulk advective flow.

10861 (DOE/ID/12735–T34) **Projects at the Western Environmental Technology Office. Quarterly technical progress report, October 1–December 31, 1994.** MSE, Inc., Butte, MT (United States). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE95007651. Source: OSTI; NTIS; GPO Dep.

Effective October 1, 1994, the Component Development and Integration Facility (CDIF) formally became the Western Environmental Technology Office (WETO). This name change followed an April 6, 1994, announcement from Assistant Secretary for Environmental Restoration and Waste Management at the Department of Energy (DOE), Thomas Grumbly, that the facility would be given the new role of researching ways to clean up environmental contamination. Accompanying the name change and the new role of environmental cleanup, the facility was placed under the direction of the DOE's Environmental Management Office. This quarterly technical progress report presents progress on projects at WETO during the first quarter of FY95. WETO is operated by MSE, Inc., in Butte, Montana. Projects in progress include: Biomass Remediation Project; Heavy Metal-Contaminated Soil Project; MHD

Shutdown; Mine Waste Technology Program; Plasma Projects; Resource Recovery Project; Spray Casting Project; and Watervliet Arsenal Project.

10862 (DOE/NV–372) **Resource Conservation and Recovery Act Industrial Sites quality assurance project plan: Nevada Test Site, Nevada.** USDOE Nevada Operations Office, Las Vegas, NV (United States); IT Corp., Las Vegas, NV (United States). Jun 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-92NV10972. Order Number DE95005922. Source: OSTI; NTIS; INIS; GPO Dep.

This quality assurance project plan (QAPjP) describes the measures that shall be taken to ensure that the environmental data collected during characterization and closure activities of Resource Conservation and Recovery Act (RCRA) Industrial Sites at the Nevada Test Site (NTS) are meaningful, valid, defensible, and can be used to achieve project objectives. These activities are conducted by the US Department of Energy Nevada Operations Office (DOE/NV) under the Nevada Environmental Restoration (ER) Project. The Nevada ER Project consists of environmental restoration activities on the NTS, Tonopah Test Range, Nellis Air Force Range, and eight sites in five other states. The RCRA Industrial Sites subproject constitutes a component of the Nevada ER Project. Currently, this QAPjP is limited to the seven RCRA Industrial Sites identified within this document that are to be closed under an interim status and pertains to all field-investigation, analytical-laboratory, and data-review activities in support of these closures. The information presented here supplements the RCRA Industrial Sites Project Management Plan and is to be used in conjunction with the site-specific subproject sampling and analysis plans.

10863 (DOE/NV–10845-32) **Review of present groundwater monitoring programs at the Nevada Test Site.** Hershey, R.L.; Gillespie, D. Nevada Univ., Las Vegas, NV (United States). Desert Research Inst. Sep 1993. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95006427. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater monitoring at the Nevada Test Site (NTS) is conducted to detect the presence of radionuclides produced by underground nuclear testing and to verify the quality and safety of groundwater supplies as required by the State of Nevada and federal regulations, and by U.S. Department of Energy (DOE) Orders. Groundwater is monitored at water-supply wells and at other boreholes and wells not specifically designed or located for traditional groundwater monitoring objectives. Different groundwater monitoring programs at the NTS are conducted by several DOE Nevada Operations Office (DOE/NV) contractors. Presently, these individual groundwater monitoring programs have not been assessed or administered under a comprehensive planning approach. Redundancy exists among the programs in both the sampling locations and the constituents analyzed. Also, sampling for certain radionuclides is conducted more frequently than required. The purpose of this report is to review the existing NTS groundwater monitoring programs and make recommendations for modifying the programs so a coordinated, streamlined, and comprehensive monitoring effort may be achieved by DOE/NV. This review will be accomplished in several steps. These include: summarizing the present knowledge of the hydrogeology of the NTS and the potential radionuclide source areas for groundwater contamination; reviewing the existing groundwater monitoring programs at the NTS; examining the rationale for monitoring and the constituents analyzed; reviewing the analytical methods used to quantify tritium activity; discussing monitoring network design criteria; and synthesizing the information presented and making recommendations based on the synthesis. This scope of work was requested by the DOE/NV Hydrologic Resources Management Program (HRMP) and satisfies the 1993 (fiscal year) HRMP Groundwater Monitoring Program Review task.

10864 (DOE/NV/10845–51) **Groundwater flow near the Shoal Site, Sand Springs Range, Nevada: Impact of density-driven flow.** Chapman, J.; Mihevc, T.; McKay, A. Nevada Univ., Las Vegas, NV (United States). Desert Research Inst. Sep 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95007069. Source: OSTI; NTIS; GPO Dep.

The nature of flow from a highland recharge area in a mountain range in north-central Nevada to discharge areas on either side of the range is evaluated to refine a conceptual model of contaminant transport from an underground nuclear test conducted beneath the range. The test, known as the Shoal event, was conducted in 1963 in granitic rocks of the Sand Springs Range. Sparse hydraulic head measurements from the early 1960s suggest flow from the shot location to the east to Fairview Valley, while hydrochemistry supports flow to salt pans in Fourmile Flat to the west. Chemical and isotopic data collected from water samples and during well-logging arc best explained by a reflux brine system on the west side of the Sand Springs Range, rather than a typical local flow system where all flow occurs from recharge areas in the highlands to a central discharge area in a playa. Instead, dense saline water from the playa is apparently being driven toward the range by density contrasts. The data collected between the range and Fourmile Flat suggest the groundwater is a mixture of younger, fresher recharge water with older brine. Chemical contrasts between groundwater in the east and west valleys reflect the absence of reflux water in Fairview Valley because the regional discharge area is distant and thus there is no accumulation of salts. The refluxing hydraulic system probably developed after the end of the last pluvial period and differences between the location of the groundwater divide based on hydraulic and chemical indicators could reflect movement of the divide as the groundwater system adjusts to the new reflux condition.

10865 (EGG–11265-1057) **An aerial radiological survey of the project Rio Blanco and surrounding area.** Singman, L.V. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265. Order Number DE95007554. Source: OSTI; NTIS; INIS; GPO Dep.

A team from the Remote Sensing Laboratory in Las Vegas, Nevada, conducted an aerial radiation survey of the area surrounding ground zero of Project Rio Blanco in the northwestern section of Colorado in June 1993. The object of the survey was to determine if there were man-made radioisotopes on or near the surface resulting from a nuclear explosion in 1972. No indications of surface contamination were found. A search for the cesium-137 radioisotope was negative. The Minimum Detectable Activity for cesium-137 is presented for several detection probabilities. The natural terrestrial exposure rates in units of Roentgens per hour were mapped and are presented in the form of a contour map over-laid on an aerial photograph. A second team made independent ground-based measurements in four places within the survey area. The average agreement of the ground-based with aerial measurements was six percent.

10866 (EGG–11265-1081) **An aerial radiological survey of the neutron products company and surrounding area.** Vojtech, R.J. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Dec 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265. Order Number DE95007553. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey was conducted from November 1-10, 1993, over the Neutron Products Company and neighboring areas. The company, located in Dickerson, Maryland, has two major operations involving the radioisotope cobalt-60 (^{60}Co)-the manufacture of commercial ^{60}Co sources and the sterilization of medical products by exposure to radiation. The sterilization facility consists of two ^{60}Co sources with activities of approximately 500,000 and 1,500,000 Ci, respectively. The purpose of the aerial survey was to detect and document any anomalous gamma-emitting radionuclides in the environment which may have resulted from operations of the Neutron Products Company. The survey covered two areas: the first was a 6.5- by 6.5-kilometer area centered over the Neutron Products facility; the second area was a 2- by 2.5-kilometer region surrounding a waste pumping station on Muddy Branch in Gaithersburg, Maryland. This site is approximately fifteen kilometers southeast of the Neutron Products facility and was included because sanitary and other liquid waste materials from the plant site are being disposed of at the pumping station. Contour maps showing gamma radiation exposure rates at

1 meter above ground level, overlaid on an aerial photo of the area, were constructed from the data measured during the flights. The exposure rates measured within the survey regions were generally uniform and typical of rates resulting from natural background radiation. Only one area showed an enhanced exposure rate not attributable to natural background. This area, located directly over the Neutron Products facility, was analyzed and identified as ^{60}Co, the radioisotope used in the irradiation and source production operations conducted at the Neutron Products Company. The measurements over the Muddy Branch area in Gaithersburg were typical of natural background radiation and showed no evidence of ^{60}Co or any other man-made radionuclide.

10867 (EGG-M–94147) **Using the inverse Chirp-Z transform for time-domain analysis of simulated radar signals.** Frickey, D.A. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9410164–6: ICSPAT 94: signal procession applications and technology, Dallas, TX (United States), 18-21 Oct 1994). Order Number DE95005022. Source: OSTI; NTIS; GPO Dep.

There exists a need to develop a method to locate underground voids, or caches. In the past, ground penetrating radar (GPR) operating in the time domain mode has been used. In this paper, we turn our attention to stepped frequency radar, capable of making frequency domain reflection coefficient measurements. We then apply the inverse Chirp-Z transform (ICZT) to this data, generating a time domain response. The scenario under consideration is that of an airborne radar passing over the surface of the earth. The radar is directed toward the surface and is capable of measuring the reflection coefficient, seen looking toward the earth, as a function of frequency. The frequency domain -data in this work is simulated and is generated from a transmission line model of the problem. Using the ICZT we convert this frequency domain data to the time domain. Once in the time domain, reflections due to discontinuities appear at times indicating their relative distance from the source. The discontinuities occurring beyond the surface of the earth could be indicative of underground structures. The ICZT allows a person to zoom in on the time span of interest by specifying the starting time, the time resolution, and the number of time steps.

10868 (ENEA-RT-AMB–93-28) **Portable Kit for inroad sampling on environmental matrixes.** Beone, F. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Beone, G.; Beone, T.; Zocchi, L. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Mar 1994. 68p. (In Italian). (RT/AMB–93-28). Order Number DE95749668. Source: OSTI; NTIS (US Sales Only).

Many national organisms are called to effect rapid controls on environmental conditions and on the correct disposal of industrial and urban wastes, performing inroad sampling of ground, water or solid/liquid wastes. A recent research has demonstrated that tools for inroad samplings, for rapid and not programmed interventions, on environmental matrixes don't exist. The Kit prototype, patented by ENEA (Italian Agency for New Technologies, Energy and the Environment), also tested by different external operators, matching the demand, posses the required requisite of simplicity of use, rapidity of employment, easy transportability for weightlessness and compactness, reliability of samples (according with the present Italian laws), samples correct conservation, large analytical range sampleabilty.

10869 (ENEA-RT-AMB–94-17) **Soil erosion measurement in Abruzzo (Italy): Comparison among different methodologies.** Grauso, S. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Jun 1994. 42p. (In Italian). (RT/AMB–94-17). Order Number DE95749691. Source: OSTI; NTIS (US Sales Only).

In this report, preliminary results are discussed come out from the researches carried out with the aim to verify the reliability of some theoretical methods for the evaluation of soil erosion. The methods here put in comparision are based on the use of analytical relations and mathematical models, precisely: analytical relations between river suspension load and geomorphic parameters such as drainage density and hierarchical anomaly index; Wischmeyer's equation (USLE, Universal Soil Loss Equation); CREAMS(Chemical, Runoff and Erosion from Agricultural Management Systems) model; WEEP(Water Erosion Prediction Project) model. The results obtained at the end of the first cycle of observations demonstrate that mathematical models are not yet perfectly got ready and need some adjustments. The best results, nearest to the in-field registered values, were those come out from the application of relations between suspension load and geomorphic parameters.

10870 (ENEA-RT-INN–94-35) **Photosyntetic activity and electron trasport measurements using laser pump and probe technique.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Colao, F.; Fantoni, R.; Palucci, A.; Ribezzo, S.; Di Marco, G.; Massacci, A.; Loreto, F. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Oct 1994. 28p. (RT/INN–94-35). Order Number DE95749722. Source: OSTI; NTIS (US Sales Only).

The lidar fluorosensor apparatus available at ENEA (Italian Agency for New Technologies, Energy and the Environment) Frascati has been used for a series of laboratory measurements of the photosynthetic electron transport in maize plants. The system, recently upgraded with a short pulse Nd: YAG laser, has been rearranged to test a new technique based on laser pump (XeCl) and probe (Nd: YAG) excitation efficiency. Experimental results will be presented and compared to those obtained by a PAM (Pulse Amplitude Modulation) Fluorometer.

10871 (INIS-BR–3459) **New fission track constrains on the uplift and erosion history of SE Brazil.** Gallagher, K. (Open Univ., Milton Keynes (United Kingdom)); Hawkesworth, C.J.; Mantonavi, M.S.M.; Lewis, C. Sociedade Brasileira de Geofisica, Salvador, BA (Brazil). Div. Nordeste Meridional. 1991. 4p. 10872 (INIS-mf–14465) **Cesium 137 in oils and plants from Guatemala.** Ciencia y Tecnologia Nuclear, v. 11-2. Ayala, R.E. (Seccion Industrial, Direccion General de Energia Nuclear (Guatemala)); Perez, J.F. Direccion General de Energia Nuclear, Guatemala City (Guatemala). 1993. 5p. (In Spanish). Order Number DE95617826. Source: OSTI; NTIS (US Sales Only); INIS.

Since 1990 the project of radioactive and environmental contamination started in Guatemala. Studies about the radioactive contamination levels are made within the framework of this project. Cesium-137 has been an interest radionuclide, because it is a fission product released to the environment by the use of nuclear weapons and nuclear power plants accidents. The sampling consisted in collection of soil and grass in 20 provinces of Guatemala, one point by province, and it was made in 1990. The cesium-137 concentration in the samples, was determined by gamma spectrometry, using an hyper pure germanium detector. The results show the presence of radioactive contamination in soil and grass due to cesium-137, at levels that might be considered as normal. The levels found are not harmful for human health, and its importance is the fact that can be used as reference levels for the environmental radioactivity monitoring in Guatemala.

10873 (INIS-mf–14471) **Transactions of the nuclear societies of Israel joint meeting 1994.** Transactions of the nuclear societies of Israel, v. 18. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. 234p. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The 18th convention of the Israel nuclear societies transactions book contains presentations in the following topics: reactor

physics, health physics, radiation protection, nuclear medicine and general reviews about the status of nuclear energy in Israel.

10874 (INIS-mf–15085, pp. 79-85) **Demands on the sampling of milk, plants, animal feeds, fertilizers and soil for radioactivity monitoring.** Wiechen, A. (Inst. fuer Chemie und Physik der Bundesanstalt fuer Milchforschung, Kiel (Germany)). Bundesamt fuer Strahlenschutz, Berlin (Germany); Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). 1992. 292p. (In German). (CONF-9210498–: 2. colloquy on the integrated measuring and information system (IMIS) for monitoring environmental radioactivity - application of the routine measuring program in the five new Federal German States -, Berlin (Germany), 12-14 Oct 1992). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

Conclusions were drawn from experience gathered after the Chernobyl accident, and relevant principles formulated. Considerations for sampling are presented. The exact execution of the routine program will be the criterion of succeeding, also in case of an event, to manage monitoring along appropriate, orderly lines, and to make optimum use of the possibilities offered by IMIS. (orig./DG)

10875 (INIS-mf–15085, pp. 87-95) **Special aspects of sampling for radiation monitoring of food.** Heilgeist, M. (Bundesforschungsanstalt fuer Ernaehrung, Zentrallaboratorium fuer Isotopentechnik, Karlsruhe (Germany)); Mueller, H. Bundesamt fuer Strahlenschutz, Berlin (Germany); Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). 1992. 292p. (In German). Source: OSTI; NTIS (US Sales Only); INIS.

Within the range of activities of the control station for radioactivity monitoring of food, studies of specific food, in particular outdoor vegetables, are of priority, because the results of such studies are best suited for providing hints on a possible contamination by radioactive fallout. By means of computer calculation models based, among other data, on nuclide-specific parameters, consumption quantitities and habits, the ingestion dose to be expected can be quickly estimated. The radio-ecological food chain model 'ECOSYS' and the 'Program System for Estimating and Limiting Radiological Consequences of Large-Scale Radionuclide Releases' (PARK) based on it, provide appropriate data within the 'Integrated Measuring and Information System' (IMIS). In addition, measures for dose minimization can be derived from the measured values. (orig./DG)

10876 (INIS-mf–15085, pp. 129-135) **Notes on sample preparation of food: food of plant and animal origins, and daily meals.** Heilgeist, M. (Bundesforschungsanstalt fuer Ernaehrung, Zentrallaboratorium fuer Isotopentechnik, Karlsruhe (Germany)). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

The procedure of food sample preparation to determine their specific radioactivity, analogous to chemical residue analysis, is laid down in the relevant sets of regulations. Several procedural steps of sample preparation of single food and composite food are dealt with. The sample size necessary for gamma spectroscopy and Sr-89/Sr-90 analysis, and the incineration step to enrich radionuclides are explained. Finally, enrichment by freeze drying of the high-volatile radionuclide I-131 is considered. (orig.)

10877 (INIS-mf–15085, pp. 137-140) **Demands on sample preparation of milk, milk products, plants, animal feeds, fertilizers and soil for radioactivity monitoring.** Wiechen, A. Source: OSTI; NTIS (US Sales Only); INIS.

In order to achieve comparability of measurement and analysis results, sample preparation rules have to be strictly observed by all laboratories concerned. Subsequently, considerations concerning sample preparation of milk, milk products, plants, animal feeds, fertilizers and soil, as far as laid down in the rules of measurement instructions for environmental radioactivity monitoring and detection of radioactive emissions from nuclear facilities, are touched. New developments in analysis and measurement techniques involving a possible simplification of sample preparation are outlined. (orig./DG)

10878 (INIS-mf–15085, pp. 173-185) **Special applications of gamma spectroscopy: on-line and in-situ spectroscopy.** Zaehringer, M. (Inst. fuer Atmosphaerische Radioaktivitaet, Bundesamt fuer Strahlenschutz, Freiburg im Breisgau (Germany)); Rogowski, J.; Weiss, W. Bundesamt fuer Strahlenschutz, Berlin (Germany); Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). 1992. 292p. (In German). (CONF-9210498–: 2. colloquy on the integrated measuring and information system (IMIS) for monitoring environmental radioactivity - application of the routine measuring program in the five new Federal German States -, Berlin (Germany), 12-14 Oct 1992). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

The application of gamma spectroscopy within the framework of IMIS gains in importance for the federal measurement networks which during intensive operation have to provide in two-hour intervals automatically evaluated data sets. In particular, this refers to the continuously working, nuclide-specific aerosol monitors of the German Weather Service (DWD), and to the in-situ spectrometers of the alarm system, the DWD and the German federal states. The regulations established under IMIS for the application of on-line gamma spectroscopy, and questions related to in-situ spectroscopy are dealt with. More attention is paid to practical aspects than to the theoretical foundations necessary for the application of these methods. (orig./DG)

10879 (INPE–5505-TDI-517) **Cesium-137 and natural radionuclides in soils from southern Brazil and soils and others environmental samples from Antarctic.** Schuch, L.A. Instituto de Pesquisas Espaciais (INPE), Sao Jose dos Campos, SP (Brazil); Santa Maria Univ., RS (Brazil). Apr 1993. 180p. (In Portuguese). Order Number DE95621018. Source: OSTI; NTIS (US Sales Only); INIS.

This work presents a study of environmental artificial and natural radioactivity levels in soil samples from the Southern Brazil and in

soils and other environmental samples form Antarctica. Artificial radioactivity was determined by measuring Cs-137 which is a 30.1 year half-life man-made radionuclide produced in the past by atmospheric tests of nuclear weapons. Natural radioactivity was determined by measuring some radionuclides belonging to Th-232 and U-238 natural radioactive families, and of K-40 concentrations. Several types of soils from Southern Brazil; and soil samples, marine sediments, lichens, mosses and algae collected at King George and other nearby islands (South Shetland Archipelago, Antarctica) were analyzed. A gamma-ray spectrometer was used to measure radioactivity levels of the collected samples and its overall characteristics are analyzed in this work. (author).

Radiography is applied to investigate the penetration of radioactive contaminations in plants and soils. In particular, in the case of the Chernobyl accident the total concentrations of fission elements and cesium were determined by (n,f) radiography.

10881 (JINR-E-3-93-61, pp. 138-141) **Usage of the solid-state nuclear detectors for study of the dispersity composition and fuel fallout alpha-activity in the water-soil media after the Chernobyl accident.** Victorova, N.V.; Demchuk, V.V.; Tratyakova, S.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 205p. (CONF-9203318--: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. 10883 (JINR-R-16-94-338) **Investigation of Radionuclide Concentrations in Pine Needles in Vietnam after the Chernobyl Accident.** Bat, L.T. (Institute of Nuclear Science and Technology, Hanoi (Viet Nam)); Minh, D.A.; Thu, T.S.; Tuan, V.H.; Dong, N.V.; Vhu, N.N.; Phong, N.V.; Vinh, C.N.; Len, H.T.; Bamblevskij, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Dept. of Radiation Safety. 1994. 7p. (In Russian). Order Number DE95621233. Source: OSTI; NTIS (US Sales Only); INIS.

This work presents the results of measurements concentrations in pine needles in Vietnam after the Chernobyl accident. Investigations were made since second half of 1986 to 1988. Increasing of concentration radionuclide levels in 1986 was not significant and was ended at the end of 1987. The concentrations of radionuclide Cs-137 in pine needles were compared with those in precipitations. The pine needles can be recommended as a useful and accessible material for supplementary monitoring of radioactive situation in the environment. The results obtained can contribute to the overall picture of studies on the dynamics of radioactive distribution and global fallouts formed by macro scale nuclear accidents. 10884 (KFK-5364) **Description of NORMTRI: a computer program for assessing the off-site consequences from airborne releases of tritium during normal operation of nuclear facilities.** Raskob, W. (Trippe und Partner Ingenieurgesellschaft mbH, Karlsruhe (Germany)). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik. Oct 1994. 71p. Order Number DE95752051. Source: OSTI; NTIS (US Sales Only); INIS.

The computer program NORMTRI has been developed to calculate the behaviour of tritium in the environment released into the atmosphere under normal operation of nuclear facilities. It is possible to investigate the two chemical forms tritium gas and tritiated water vapour. The conversion of tritium gas into tritiated water followed by its reemission back to the atmosphere as well as the conversion into organically bound tritium is considered. NORMTRI is based on the statistical Gaussian dispersion model ISOLA, which calculates the activity concentration in air near the ground contamination due to dry and wet deposition at specified locations in a polar grid system. ISOLA requires a four-parametric meteorological statistics derived from one or more years synoptic recordings of 1-hour-averages of wind speed, wind direction, stability class and precipitation intensity. Additional features of NORMTRI are the possibility to choose several dose calculation procedures, ranging from the equations of the German regulatory guidelines to a pure specific equilibrium approach. (orig.)

10885 (LA-SUB-95-11) **Stochastic analysis of transport of conservative solutes in caisson experiments.** Dagan, G. Los Alamos National Lab., NM (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006698. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory has conducted in the past a series of experiments of transport of conservative and reactive solutes. The experimental setup and the experimental results are presented in a series of reports. The main aim of the experiments was to validate models of transport of solutes in unsaturated flow at the caisson intermediate scale, which is much larger than the one pertaining to laboratory columns. First attempts to analyze the experimental results were by one-dimensional convective-dispersion models. These models could not explain the observed solute breakthrough curves and particularly the large solute dispersion in the caisson effluent Since there were some question marks about the uniformity of water distribution at the caisson top, the transport experiments were repeated under conditions of saturated flow. In these experiments constant heads were applied at the top and the bottom of the caisson and the number of concentration monitoring stations was quadrupled. The analysis of the measurements by the same one-dimensional model indicated clearly that the fitted dispersivity is much larger than the pore-sole dispersivity and that it grows with the distance in an approximately linear fashion. This led to the conclusion, raised before, that transport in the caisson is dominated by heterogeneity effects, i.e. by spatial variability of the material Such effects cannot be captured by traditional one-dimensional models. In order to account for the effect of heterogeneity, the saturated flow experiments have been analyzed by using stochastic transport modeling. The apparent linear growth of dispersivity with distance suggested that the system behaves like a stratified one. Consequently, the model of Dagan and Bresier has been adopted in order to interpret concentration measurements. In this simple model the caisson is viewed as a bundle of columns of different permeabilities, which are characterized by a p.d.f. (probability denasity function).

10886 (LA-SUB-95-19) **Evaluation of potential surface rupture and review of current seismic hazards program at the Los Alamos National Laboratory. Final report.** Los Alamos National Lab., NM (United States); Woodward-Clyde Consultants, Oakland, CA (United States). 9 Dec 1991. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006699. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the authors review and evaluation of the existing seismic hazards program at Los Alamos National Laboratory (LANL). The report recommends that the original program be

augmented with a probabilistic analysis of seismic hazards involving assignment of weighted probabilities of occurrence to all potential sources. This approach yields a more realistic evaluation of the likelihood of large earthquake occurrence particularly in regions where seismic sources may have recurrent intervals of several thousand years or more. The report reviews the locations and geomorphic expressions of identified fault lines along with the known displacements of these faults and last know occurrence of seismic activity. Faults are mapped and categorized into by their potential for actual movement. Based on geologic site characterization, recommendations are made for increased seismic monitoring; age-dating studies of faults and geomorphic features; increased use of remote sensing and aerial photography for surface mapping of faults; the development of a landslide susceptibility map; and to develop seismic design standards for all existing and proposed facilities at LANL.

10887 (LBL–35569) **New barrier fluids for subsurface containment of contaminants.** Moridis, G.J.; Persoff, P.; Holman, H.Y.; Muller, S.J.; Pruess, K.; Radke, C.J. Lawrence Berkeley Lab., CA (United States). Oct 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-931095–87: Department of Energy environmental remediation conference, Augusta, GA (United States), 24-28 Oct 1993). Order Number DE95006581. Source: OSTI; NTIS; GPO Dep.

In some situations, containment of contaminants in the subsurface may be preferable to removal or treatment in situ. In these cases, it maybe possible to form barriers by injecting fluids (grouts) that set in place and reduce the formation permeability. This paper reports laboratory work to develop two types of fluids for this application: colloidal silica (CS) and polysiloxane (PSX). Falling-head permeameter tests of grouted Hanford sand, lasting 50 days, showed hydraulic conductivities of order 10^{-7} cm/sec for these two materials. Low initial viscosity of the grout is necessary to permit injection without causing fracturing or surface uplift. Experiments with crosslinked polysiloxanes showed that they could be diluted to achieve adequately low viscosity without losing their ability to cure. Control of the gel time is important for grout emplacement. Gel time of CS grouts increased with increasing pH (above 6.5) and with decreasing ionic strength. Salt solutions were added to the colloid-to increase the ionic strength and control gel time. When injected into Hanford sand, the CS grout gelled much more quickly than the same formula without sand. This effect results from salinity that is present in pore water and from multi-valent ions that are desorbed from clays and ion-exchanged for mono-valent ions in the grout. Ion-exchange experiments showed that most of the multi-valent ions could be removed-by flushing the sand with 15 PV of 4% NaCl and sand treated in this manner did not accelerate the gelling of the grout. When grout is injected into unsaturated soil it slumps, leaving the soil only partially saturated and achieving less permeability reduction upon gelling. Multiple injections of CS grout in 1-D sand columns demonstrated that by accumulating the residual gelled grout saturations from several injections, low permeability can be achieved.

10888 (NEI-DK–1837) **Disposal of slightly polluted soils. 1: Evaluation of oil and gasoline polluted soils.** Arbejdsrapport fra Miljoestyrelsen, 48. Andersen, L. (COWIconsult A/S (Denmark)). Miljoestyrelsen, Copenhagen (Denmark). 1994. 190p. (In Danish). Order Number DE95744841. Source: OSTI; NTIS.

The purpose is to evaluate the possibility of disposal of slightly polluted soils at a usual waste dump, and the environmental consequences of such disposal. The soils in question would contain oils and gasoline. There are few data available on isoprenoids and polar compounds, the components considered in the present report are: n-hexane, benzene, toluene, m-xylene, ethylbenzene, naphtalene and benz(a)pyrene. Chemical composition of the pollutants, soil types, porosity and humidity, biodegradation, ecotoxicology, effects of chemicals like PAHs on plant growth, membrane effects and percolaion into ground water, as well as maximum permissible limits of chemicals in usual disposal sites are considered. In the existing draft the criteria for 'clean' soil are 25 mg gasoline per kg soil and 50 mg gas oil per kg soil. The proposed toxicologic limits are maximum 1.5 mg benzene per kg soil. For the presumed composition these values correspond to roughly 75 mg gasoline per kg soil and roughly 150 mg diesel per kg soil. (EG)

10889 (NEI-DK–1838) **Disposal of slightly polluted soils. 2: Evaluation of soils polluted by gas utilities.** Arbejdsrapport fra Miljoestyrelsen, 49. Andersen, L. (COWIconsult A/S (Denmark)). Miljoestyrelsen, Copenhagen (Denmark). 1994. 211p. (In Danish). Order Number DE95744842. Source: OSTI; NTIS.

The purpose is to evaluate the possibility of disposal of slightly polluted soils at a usual waste dump and the environmental consequences of such disposal. Soil from a gas utility would be typically affected by following pollutants: coal- and cokedust from storage heaps, containing hydrocarbons and metals; tar components from handling and storage of tar; phenols, ammonia, sulfates and cyanates related to ammonia processing; cyanides, cyanates, sulfides and sulfates related to purification systems and bog iron ore processing; oil from the oil washers. Specially the tar components and cyanide compounds are considered in the present evaluation. Chemical composition of the potential pollutants, soil types, porosity and humidity, biodegradation, ecotoxicology, effects upon plants of chemicals like tar and PAHs, membrane effects and percolation into ground water, evaporation and gas concentration in the air pores of the disposed soils are discussed. Benzene, toluene, phenols, naphtalene, phenanthrene, benzopyrene, quinoline and cyanide acceptable concentration limits for a disposal site were evaluated. (EG)

10890 (NEI-DK–1839) **Disposal of slightly polluted soils. 3: Evaluation of soils polluted by heavy metals.** Arbejdsrapport fra Miljoestyrelsen, 50. Andersen, L. (COWIconsult A/S (Denmark)). Miljoestyrelsen, Copenhagen (Denmark). 1994. 246p. (In Danish). Order Number DE95744843. Source: OSTI; NTIS.

The purpose is to evaluate the possibility of disposal of slightly polluted soils at a usual waste dump, and the environmental consequences of such disposal. The most typical heavy metal pollutants in the soils here considered would be: arsenic, lead, cadmium, copper, chromium, mercury, nickel, vanadium and zinc. This report comprehends the chemical concentration of specific heavy metals, their biodegradability, ecotoxicology, uptake by plants, percolation, membrane effects, effect upon surface waters. According to the proposed criteria there are the following permissible limits for a ton of disposed municipal wastes: 100 g Pb, Cu, Cr, Ni and Zn, 10 g Cd, ^{9} Hg and 1 g As. The wastes are considered hazardous when the above-mentioned values are exceeded by a factor of 2.6 in the eluate tested. (EG)

10891 (OPRI-RM–7-1994) **Monthly results of measurements; July 1994.** Office de Protection contre les Rayonnements Ionisants, 78 - le Vesinet (France). 1995. 50p. (In French). Order Number DE95619985. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the OPRI exposes the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

10892 (OPRI-RM–8-1994) **Monthly results of measurements: August 1994.** Office de Protection contre les Rayonnements Ionisants, 78 - le Vesinet (France). 1994. 50p. (In French). Order Number DE95619986. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the OPRI (Office of Protection against Ionizing Radiation) exposes the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

10893 (ORNL/M–3024) **Environmental surveillance data report for the third quarter of 1993.** Hughes, P.D.; Gheesling, S.E.; Gideon, J.C.; Gregory, S.M.; Hamilton, L.V.; Hughes, J.F.; Loffman, R.S.; Salmons, M.C.; Stevens, M.M. Oak Ridge National Lab., TN (United States). Dec 1994. 138p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006357. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Surveillance and Protection Section within the Office of Environmental Compliance and Documentation at the Oak Ridge National Laboratory (ORNL) is responsible for the development and implementation of an environmental program to (1) ensure compliance with all federal, state, and Department of Energy (DOE) reporting requirements to quantitatively demonstrate prevention, control, and abatement of environmental pollution; (2) monitor the adequacy of containment and effluent controls; and (3) assess impacts of releases from ORNL facilities on the environment. Environmental monitoring consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is the collection and analysis of samples or measurements of liquid and gaseous effluents. Environmental surveillance is the collection and analysis of samples, or direct measurements of air, water, soil, foodstuff, biota, and other media from DOE sites and their environs. Monthly or quarterly summaries are presented in this re-port for each medium sampled. All data are rounded to two significant digits. The summary tables generally give the number of samples collected during the period and the maximum, minimum, average, and standard error of the mean (SE) values of parameters for which determinations were made.

10894 (ORNL/TM–12817, pp. 371-380) **Evaluation of new and conventional thermoluminescent phosphors for environmental monitoring using automated thermoluminescent dosimeter readers.** Rathbone, B.A. (Pacific Northwest Lab., Richland, WA (United States)); Endres, A.W.; Antonio, E.J. Oak Ridge National Lab., TN (United States). Oct 1994. DOE Contract AC06-76RL01830. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years there has been considerable interest in a new generation of super-sensitive thermoluminescent (TL) phosphors for potential use in routine personnel and environmental monitoring. Two of these phosphors are evaluated in this paper for selected characteristics relevant to environmental monitoring, along with two conventional phosphors widely used in environmental monitoring. The characteristics evaluated are light-induced fading, light-induced background, linearity and variability at low dose, and the minimum measurable dose. These characteristics were determined using an automated commercial dosimetry system and routine processing protocols. Annealing and readout protocols for each phosphor were optimized for use in a large-scale environmental monitoring program.

10895 (ORNL/TM–12817, pp. 381-396) **Harshaw/Bicron 8807 environmental dosemeter - Implementation issues.** Lawson, B.J. (Knolls Atomic Power Lab., Schenectady, NY (United States)); Moleski, M.; Karandy, R.; Phillips, C.R.; Champagne, R.; Winslow, R.J. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides details regarding implementation of the Harshaw/Bicron 8807 dosemeter for field use in an environmental monitoring program. The paper discusses special precautions which must be taken to ensure accuracy and reproducibility. Specifically, light sensitivity should be eliminated and temperature dependent fade accounted for. Seasonal bias of +15% to +50% can result if this is not done.

10896 (ORNL/TM–12931) **Treatability of TCE-contaminated clay soils at the Rinsewater Impoundment, Michoud Assembly Facility.** Lucero, A.J.; Gilbert, V.P.; Hewitt, J.D.; Koran, L.J. Jr.; Jennings, H.L.; Donaldson, T.L.; West, O.R.; Cline, S.R.; Marshall, D.S. Oak Ridge National Lab., TN (United States). Feb 1995. 42p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008106. Source: OSTI; NTIS; GPO Dep.

The Oak Ridge National Laboratory has conducted treatability studies on clay soils taken from the Rinsewater Impoundment at the National Aeronautics and Space Administration Michoud Assembly Facility. The soils are contaminated with up to 3000 mg/kg of trichloroethylene and cis-1,2-dichloroethylene, less than 10 mg/kg of trans-1,2-DCE, and less than 10 mg/kg of vinyl chloride. The goal of the study described in this report was to identify and test in situ technologies and/or develop a modified treatment regime to remove or destroy volatile organic compounds from the contaminated clay soils. Much of the work was based upon previous experience with mixed-region vapor stepping and mixed-region peroxidation. Laboratory treatments were performed on intact soil cores that were taken from contaminated areas at the Rinsewater Impoundment at MAF. Treatability studies were conducted on soil that was close to in situ conditions in terms of soil structure and contaminant concentrations.

10897 (PNL–10377) **Re-analysis of hydraulic tests conducted for Well 4A.** Spane, F.A. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005710. Source: OSTI; NTIS; GPO Dep.

This report provides results from a re-analysis of the constant-rate pumping test and slug interference test conducted at wells 4A - 4T on the Hanford Reservation. The re-analysis includes the effects of wellbore storage, partial penetration, and vertical anisotropy. The re-analysis demonstrates that comparable results were obtained from both the pumping and slug interference characterization tests.

10898 (PNL-SA–24081) **In situ soil remediation using electrokinetics.** Buehler, M.F.; Surma, J.E.; Virden, J.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 34p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941124–16: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007283. Source: OSTI; NTIS; INIS; GPO Dep.

Electrokinetics is emerging as a promising technology for in situ soil remediation. This technique is especially attractive for Superfund sites and government operations which contain large volumes of contaminated soil. The approach uses an applied electric field to induce transport of both radioactive and hazardous waste ions in soil. The transport mechanisms include electroosmosis, electromigration, and electrophoresis. The feasibility of using electrokinetics to move radioactive ^{137}Cs and ^{60}Co at the Hanford Site in Richland, Washington, is discussed. A closed cell is used to provide in situ measurements of ^{137}Cs and ^{60}Co movement in Hanford soil. Preliminary results of ionic movement, along with the corresponding current response, are presented.

10899 (PNL-SA–24087) **Enhancing the design of in situ chemical barriers with multicomponent reactive transport modeling.** Sevougian, S.D.; Steefel, C.I.; Yabusaki, S.B. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–13: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007267. Source: OSTI; NTIS; INIS; GPO Dep.

This paper addresses the need for systematic control of field-scale performance in the emplacement and operation of in situ chemical treatment barriers; in particular, it addresses the issue of how the local coupling of reaction kinetics and material heterogeneities at the laboratory or bench scale can be accurately upscaled to the field. The authors have recently developed modeling analysis tools that can explicitly account for all relevant chemical reactions that accompany the transport of reagents and contaminants through a chemically and physically heterogeneous subsurface rock or soil matrix. These tools are incorporated into an enhanced design methodology for in situ chemical treatment technologies, and the new methodology is demonstrated in the ongoing design of a field experiment for the In Situ Redox Manipulation

(ISRM) project at the U.S. Department of Energy (DOE) Hanford Site. The ISRM design approach, which systematically integrates bench-scale and site characterization information, provides an ideal test for the new reactive transport techniques. The need for the enhanced chemistry capability is demonstrated by an example that shows how intra-aqueous redox kinetics can affect the transport of reactive solutes. Simulations are carried out on massively parallel computer architectures to resolve the influence of multiscale heterogeneities on multicomponent, multidimensional reactive transport. The technology will soon be available to design larger-scale remediation schemes.

10900 (PNL-SA-24123) **Erace–an integrated system for treating organic-contaminated sites.** Caley, S.M.; Heath, W.O.; Bergsman, T.M.; Gauglitz, P.A.; Pillay, C.; Moss, R.W.; Shah, R.R.; Goheen, S.C.; Camiaoni, D.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–17: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007280. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy's (DOE) Pacific Northwest Laboratory (PNL) is developing a suite of electrical technologies for treating sites contaminated with hazardous organic compounds. These include: (1) Six-Phase Soil Heating (SPSH) to remove volatile and semi-volatile organic compounds from soils; (2) In Situ Corona (ISC) to decompose nonvolatile and bound organic contaminants in soils; (3) High-Energy Corona (HEC) to treat contaminated off-gases; and (4) Liquid Corona (LC) to treat contaminated liquids. These four technologies comprise ERACE (Electrical Remediation at Contaminated Environments), an integrated system for accomplishing site remediation with little or no secondary wastes produced that would require off-site treatment or disposal. Each ERACE technology can be employed individually as a stand-alone treatment process, or combined as a system for total site remediation. For example, an ERACE system for treating sites contaminated with volatile organics would integrate SPSH to remove the contaminants from the soil, LC to continuously treat an aqueous stream condensed out of the soil off-gas, and HEC to treat non-condensibles remaining in the off-gas, before atmospheric release.

10901 (PNL-SA-24702) **The UFA technology for characterization of in situ barrier materials.** Wright, J. (Pacific Northwest Lab., Richland, WA (United States)); Conca, J.L. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC06-76RL01830. (CONF-941124–15: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007284. Source: OSTI; NTIS; GPO Dep.

Site characterizations, choices of remedial strategies for site restoration, and performance assessments of chosen strategies all require knowledge of the transport properties for subsurface materials, such as hydraulic conductivities, diffusion coefficients, sorption properties, and in situ recharge rates. Unsaturated conditions in the vadose zone are especially difficult to investigate because of the extreme variability in the transport properties of geologic materials as a function of water content. A new technique, the Unsaturated Flow Apparatus (UFA), was developed to rapidly attain hydraulic steady-state in all porous/fractured media, including multicomponent/multiphase systems. The larger driving forces obtainable with centrifugation techniques are combined with precision fluid flow through a rotating seal. Hydraulic steady state is achieved in a period of hours to days, instead of months to years, depending on the target water content and intrinsic permeability of the material. Barrier materials such as bentonite slurries, chemical barriers, cements, and asphalt concretes can be rapidly run in the UFA prior to emplacement to fine-tune formulations and identify any site-specific or substrate-specific problems that could not be identified without actual field testing.

10902 (PNL-SA-25362) **Use of mass spectrometric methods for field screening of VOC's.** Evans, J.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411180–1-Vugraphs: Air and Waste Management Association annual conference, Eugene, OR (United States), 16-18 Nov 1994). Order Number DE95004903. Source: OSTI; NTIS; INIS; GPO Dep.

Includes viewgraphs.

While mass spectrometric (MS) methods of chemical analysis, particularly gas chromatography-mass spectrometry (GC/MS), have been the mainstay of environmental organic analytical techniques in the laboratory through the use of EPA and other standard methods, field implementation is relatively rare. Instrumentation and methods now exist for utilizing MS and GC/MS techniques in the field for analysis of VOC's in gas phase, aqueous, and soil media. Examples of field investigations utilizing HP 5971A and Viking SpectraTrak systems for analysis of VOC's in all three media will be presented. Mass spectral methods were found to offer significant advantages in terms of speed of analysis and reliability of compound identification over field gas chromatography (GC) methods while preserving adequate levels of detection sensitivity. The soil method in particular provides a method for rapid in-field analysis of methanol preserved samples thus minimizing the problem of volatiles loss which typically occurs with routine use of the EPA methods and remote analysis. The high cost of MS instrumentation remains a major obstacle to more widespread use.

10903 (PNL-SA-25615) **Dual-gas tracers for subsurface characterization and NAPL detection.** Gauglitz, P.A.; Peurrung, L.M.; Mendoza, D.P.; Pillay, G. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411183–1: 2. tracer workshop, Austin, TX (United States), 14-15 Nov 1994). Order Number DE95005961. Source: OSTI; NTIS; INIS; GPO Dep.

Effective design of in situ remediation technologies often requires an understanding of the mass transfer limitations that control the removal of contaminants from the soil. In addition, the presence of nonaqueous phase liquids (NAPLs) in soils will affect the ultimate success or failure of remediation processes. Knowing the location of NAPLs within the subsurface is critical to designing the most effective remediation approach. This work focuses on demonstrating that gas tracers can detect the location of the NAPLs in the subsurface and elucidating the mass transfer limitations associated with the removal of contaminants from soils.

10904 (SA-PUB-1/94, pp. 209-234) **Response of the boreal forest ecosystem to climatic change and its silvicultural implications.** Kellomaeki, S. (Joensuu Univ. (Finland). Faculty of Forestry). Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The future mean annual temperature is expected to be two to three degrees centigrade higher than at present and accompanied by lengthening of the thermal growing season and increased precipitation. Consequently, the climatic change will increase the uncertainty of the future management of the forest ecosystem. In this context, this study project aims at outlining the ecological and silvicultural implications of climatic change with regard to how the expected climatic change will possibly modify the functioning and structure of the boreal forest ecosystem, and how the silvicultural management of the forest ecosystem should be modified in order to maintain sustainable forest yield in changing climatic conditions. The total project includes several subprojects, each of them being separately described in the article.

10905 (SA-PUB-1/94, pp. 251-256) **The effects of elevated N-input and CO_2 on Sphagna with different trophic level.** Jauhiainen, J. (Joensuu Univ. (Finland). Dept. of Biology); Vasander, H. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The aim of this project is to study differences in the growth response of three Sphagnum species with different trophic level to elevated N deposition and CO_2 concentration. Within the applied concentrations of CO_2, statistically significant differences were observed within the Sphagnum species. The measured factors of production were more variable, but some evidence of the effect of CO_2 on production was gained. The effect of CO_2, like N treatment, was species dependent and had an almost opposite effect on various parameters of production, for example on dry mass of stem vs. length increment.

10906 (SA-PUB–1/94, pp. 340-345) **Geographic information system for SILMU and the modelling of soil carbon flows.** Alm, J. (Joensuu Univ. (Finland). Dept. of Biology); Lempinen, R. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

Integration of the various research themes incorporated as a single programme is a demanding task both scientifically and technically. To provide a tool for regionally based analysis and display of the results, a general purpose research database was configured in the GIS laboratory of the university of Joensuu, starting in 1992. In addition of the database system itself, a service node for GIS analysis and other possible uses of regional data was also established. The database can be used to store various background datasets, such as land use, soil maps, topography and regionally interpolated 1961-1990 climate parameters. These data can be combined and connected to other datasets and models provided by any SILMU research group.

10907 (SA-PUB–1/94, pp. 349-361) **Northern forest plants under the pressure of environmental changes.** Laine, K. (Oulu Univ. (Finland). Dept. of Botany); Huttunen, S.; Kauppi, M.; Ohtonen, R.; Baeck, J.; Havas, P.; Laehdesmaeki, P. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The effects of environmental change on the northern ecosystems will have an impact on almost all the aspects of ecosystem structure and function. Anticipating this impact is a difficult task, because there will be a combination of a great number of environmental factors. The interactions between the environmental variables will be crucial. This research programme has been carried out since 1990 to study the long-term synergistic effects of air pollutant and changing climatic conditions on the northern forest ecosystem and to increase our knowledge of climatic change and its consequences for the fragile norther nature. Ecological, physiological, morphological and biochemical methods are used to study the responses of forest trees, dwarf shrubs, lichens and soil biology to environmental changes. The research programme is divided into four subprojects concentrating on different ecosystem levels. The subprojects are: Life, growth and survival strategies of norther dwarf shrubs under the pressure of changing environment; Forest trees under the impact of air pollutants, increasing CO_2 and UV-B; Susceptibility of lichens to air pollution and climatic change and Impact of elevated atmospheric CO_2 and O_3 on soil biology with special reference to carbon allocation and N-fixation in symbiotic systems.

10908 (SA-PUB–1/94, pp. 369-374) **Climate change and forest management alternatives.** Valsta, L. (Finnish Forest Research Inst., Helsinki (Finland)); Linkosalo, T. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

Forest stand management may be facing increasing uncertainty as a result of the possible future climate change. Silvicultural options are analyzed using a simulation-optimization model that combines a forest ecosystem model with monthly climatic input data, a stochastic optimization model based on scenario approach, visualization tools for illustrating optimum solutions and the response surface of optimization, and a graphical user interface for X Window workstation environment. Preliminary results for even-aged stands in southern Finland indicate that the optimum species composition is changed by the predicted temperature rise and that increased climatic variation leads to shortened optimum rotations.

10909 (SLU-MIKRO-R–94-2) **Anaerobic decomposition of halogenated compounds with graft from anaerobically treated household wastes.** Johansson, Elisabeth. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Microbiology. 1994. 33p. (In Swedish). Order Number DE95744964. Source: OSTI; NTIS.

Anaerobic degradation of seven halogenated compounds by organisms from municipal solid waste was studied. Degradation and formation of intermediates of the freons R11, R12, R13, R22 and R114, and perchloroethylene and trichloroethylene were investigated. Microbial degradation of freon R11 started immediately, whereas R12 and R114 needed 50-100 days of acclimatization. No transformation from freon R13 and R22 was observed during the experimental period. Perchloroethylene and trichloroethylene were partially degraded to less chlorinated ethylene after an acclimatization of 10-20 days. 16 refs, 27 figs, 1 tab

10910 (SLU-REK-R–64) **Radioactive fission and activation products: Transport from soil to plant under swedish field conditions.** Mascanzoni, D. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology. 1988. 120p. Order Number DE95621020. Source: OSTI; NTIS; INIS.

The uptake of four activation products: 57 Co, 54 Mn, 65 Zn and 63 Ni, and two fission products: 90 Sr and 137 Cs by different crops was studied in a long term field experiment. Some of the soils used were sampled in the vicinity of nuclear power plants, while the others represented the most frequent types of agricultural soils occurring in Sweden. Data on the uptake by clover, timothy and wheat during the period 1976-84 were used for the calculation of soil-plant transfer factors of these nuclides. The temporal distribution of the transfer factors and the variations exhibited by the different nuclides were examined, as well as the differences between crops. The increased uptake at the early stage of the experiment observed in clover and to some extent in wheat is discussed. The soil characteristics that most influenced the uptake are the pH and the soil content of calcium, potassium and clay. The nuclide fractionation in soil was evaluated and regression analyses were employed to quantify the dependence of uptake on soil parameters. The nuclide fractions delivered to consumption through grain foods was calculated, highlighting the temporal variation of this contribution. 112 refs., 23 figs., 39 tabs.

10911 (SLU-REK-R–68) **Sorption behaviour of radiocaesium in soils from various regions of Libya and Sweden.** Shenber, Mohamed Ahmed. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology. 1992. 33p. Order Number DE95621021. Source: OSTI; NTIS; INIS.

In the last years the interest of zeolite minerals has increased. Some of them have been tested as caesium binding agents in both animals and in soil-plant systems. The sorption capacity of zeolites was high, and the experimental results showed that the zeolite materials have a considerable potential as a caesium binding agent. A significant reduction reduction in the plant uptake of ^{134}Cs, maximally by a factor of 8, was obtained in the experiments. The sorption characteristics of ^{134}Cs on soils from various regions of Libya and Sweden were studied, using batch techniques. The influence of soil parameters, contact time, and various concentrations of Cs^+, K^+ and NH_4^+ in the solution on the sorption ratio (R_s-value) for ^{134}Cs were determined by using ^{134}Cs as a tracer. Important parameters influencing the sorption were clay content, pH, and the concentration of cations, in particular that of K^+ and NH_4^+, which compete with Cs^+ for the sorption sites. The conditions influencing the exchangeability of ^{134}Cs sorbed in different soil types were studied in desorption experiments. The exchangeability of caesium was determined by extraction with 1 N Ba Cl_2 and 1 N NH_4Cl. The results showed that divalent Ba^{2+} was much less effective than the monovalent NH_4^+ in exchanging ^{134}Cs from the sorption sites in the soils. Increasing the equilibration time and drying the soils reduced the exchangeability of ^{134}Cs in most of the soils, especially the fraction exchangeable with NH_4^+. Correlations were found between the radiocaesium transfer factor for plant uptake, clay content, and sorption ratio. Simple mathematical models were used to estimate

the transfer factors for radiocaesium to wheat on soils of interest, for which no uptake data are available. 31 refs, 1 fig, 2 tabs.

10912 (SLU-REK-R--71) **Transfer of 137 Cs to milk of cow and muscle of roe deer. Investigations of dairy farms and forest areas in Central Sweden after the Chernobyl accident.** Karlen, G. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology. 1993. 30p. Order Number DE95619987. Source: OSTI; NTIS; INIS.

The thesis comprises two articles, both separately indexed, which discuss the 137 Cs content of milk and roe deer meat respectively on the basis of measurements performed in 1987 and 1988. It is concluded that the Cs content of deer will remain high much longer than the Cs content of milk. 46 refs.

10913 (SP--94-59) **Generation of earthquake signals.** Kjell, G. Swedish National Testing and Research Inst., Boraas (Sweden). 1994. 26p. Order Number DE95619989. Source: OSTI; NTIS; INIS.

Seismic verification can be performed either as a full scale test on a shaker table or as numerical calculations. In both cases it is necessary to have an earthquake acceleration time history. This report describes generation of such time histories by filtering white noise. Analogue and digital filtering methods are compared. Different methods of predicting the response spectrum of a white noise signal filtered by a band-pass filter are discussed. Prediction of both the average response level and the statistical variation around this level are considered. Examples with both the IEEE 301 standard response spectrum and a ground spectrum suggested for Swedish nuclear power stations are included in the report.

10914 (UCRL-CR--118921) **MODLP program description: A program for solving linear optimal hydraulic control of groundwater contamination based on MODFLOW simulation. Version 1.0.** Ahlfeld, D.P. (Connecticut Univ., Storrs, CT (United States). Dept. of Civil Engineering); Dougherty, D.E. Lawrence Livermore National Lab., CA (United States); Vermont Univ., Burlington, VT (United States). Research Center for Groundwater Remediation Design. Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005912. Source: OSTI; NTIS; INIS; GPO Dep.

MODLP is a computational tool that may help design capture zones for controlling the movement of contaminated groundwater. It creates and solves linear optimization programs that contain constraints on hydraulic head or head differences in a groundwater system. The groundwater domain is represented by USGS MODFLOW groundwater flow simulation model. This document describes the general structure of the computer program, MODLP, the types of constraints that may be imposed, detailed input instructions, interpretation of the output, and the interaction with the MODFLOW simulation kernel.

10915 (UCRL-JC--110055-Rev.1) **Monitoring remediation of trichloroethylene using a chemical fiber optic sensor: Field studies.** Colston, B.W.; Brown, S.B.; Langry, K.; Daley, P.; Milanovich, F.P. Lawrence Livermore National Lab., CA (United States). Jun 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851--90-Rev.1: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE95004967. Source: OSTI; NTIS; INIS; GPO Dep.

Current US Department of Energy (DOE) policy requires characterization and subsequent remediation of areas where trichloroethylene (TCE) has been discharged into the soil and groundwater. Technology that allows trace quantities of this contaminant to be measured in situ on a continuous basis is needed. Fiber optic chemical sensors offer a promising low cost solution. Field tests of such a fiber optic chemical sensor for TCE have recently been completed. Sensors have been used to measure TCE contamination at Savannah River Site (SRS) and Lawrence Livermore National Laboratory Site 300 (S300) in the groundwater and vadose zones. Both sites are currently undergoing remediation processes.

10916 (USGS/OFR--93-327) **Petrography, age, and paleomagnetism of basalt lava flows in coreholes Well 80, NRF 89-04, NRF 89-05, and ICPP 123, Idaho National Engineering Laboratory.** Lanphere, M.A. (Geological Survey, Menlo Park, CA (United States)); Champion, D.E.; Kuntz, M.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 40p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95002015. Source: OSTI; NTIS; GPO Dep.

The petrography, age, and paleomagnetism were determined on basalt from 23 lava flows comprising about 1200 feet of core from four coreholes in the Idaho National Engineering Laboratory (ML). The four coreholes are located in the southwestern part of the INEL. Paleomagnetic measurements were made on 192 samples of basalt, and K-Ar ages were measured on 19 basalt samples. All of the samples have normal magnetic polarity and were erupted during the Brunhes Normal Polarity Epoch. Basalt lava flows in ICPP 123 can be satisfactorily correlated with lava flows in the previously studied corehole at Site E, but correlations cannot be made with confidence between ICPP 123 and the other three coreholes studied in this investigation.

10917 (WHC-SD-EN-TI--263) **Geophysical investigation for proposed flow meter installation holes, 100H Area.** Kiesler, J.P. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005465. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of the surveys were to locate subsurface obstructions that may affect the drilling of two holes to be fit with flow meters in the 100-H Area of the Hanford Site (Figure 1). Possible drill sites with the least likelihood of encountering identified obstructions were identified based upon the results of the survey. Ground-penetrating radar (GPR) was the method selected for the investigations. The electromagnetic induction method was also used to verify that the general site is relatively void of metallic debris at depth.

10918 (WHC-SD-WM-CSWD--069) **Certification of version 1.2 of the PORFLO-3 code for the WHC scientific and engineering computational center.** Kline, N.W. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005596. Source: OSTI; NTIS; INIS; GPO Dep.

Version 1.2 of the PORFLO-3 Code has migrated from the Hanford Cray computer to workstations in the WHC Scientific and Engineering Computational Center. The workstation-based configuration and acceptance testing are inherited from the CRAY-based configuration. The purpose of this report is to document differences in the new configuration as compared to the parent Cray configuration, and summarize some of the acceptance test results which have shown that the migrated code is functioning correctly in the new environment.

10919 (WHC-SD-WM-DP--081) **Aqueous samples from B-Plant, Tank 9-1.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 13 Jan 1995. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005932. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the final report for the B-Plant Tank 9-1 sampling and analysis program. This report is divided into three parts: first, a narrative about the history, sampling effort, quality control, sample tracking/laboratory identification, and a summary of the analysis; second, sampling and custody data; and lastly, a set of compiled data from the laboratory analysis.

10920 (WSRC-TR--94-0349) **K-Area Acid/Caustic Basin groundwater monitoring report. Second quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1994. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005009. Source: OSTI; NTIS; INIS; GPO Dep.

During second quarter 1994, samples from the KAC-monitoring wells at the K-Area Acid/Caustic Basin were collected and analyzed for herbicides/pesticides, indicator parameters, metals, nitrate, radionuclide indicators, and other constituents. Monitoring results that exceeded the final Primary Drinking Water Standards

(PDWS), other Savannah River Site (SRS) Flag 2 criteria, of the SRS turbidity standard are provided in this report. No constituents exceeded the final PDWS in the KAC wells. Aluminum, iron, and specific conductance exceeded other SRS flagging criteria in one or more of the downgradient wells. Total organic halogens was elevated in upgradient well KAC 3. Groundwater flow direction and rate in the water table beneath the K-Area Acid/Caustic Basin were similar to past quarters.

10921 (WSRC-TR–94-0353) **L-Area Reactor - 1993 annual - groundwater monitoring report.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1994. 243p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005538. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater was sampled and analyzed during 1993 from wells monitoring the water table at the following locations in L Area: the L-Area Acid/Caustic Basin (four LAC wells), L-Area Research Wells in the southern portion of the area (outside the fence; three LAW wells), the L-Area Oil and Chemical Basin (four LCO wells), the L-Area Disassembly Basin (two LDB wells), the L-Area Burning/Rubble Pit (four LRP wells), and the L-Area Seepage Basin (four LSB wells). During 1993, tetrachloroethylene was detected above its drinking water standard (DWS) in the LAC, LAW, LCO, and LDB well series. Lead exceeded its 50 μg/L standard in the LAW, LDB, and LRP series, and tritium was above its DWS in the LAW, LCO, and LSB series. Apparently anomalous elevated levels of the common laboratory contaminant bis(2-ethylhexyl)phthalate were reported during first quarter in one well each in the LAC series and LCO series, and during third quarter in a different LCO well. Extensive radionuclide analyses were performed during 1993 in the LAC, LAW, and LCO well series. No radionuclides other than tritium were reported above DWS or Flag 2 criteria.

10922 (WSRC-TR–94-0354) **R-Area Reactor 1993 annual groundwater monitoring report.** Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1994. 349p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005539. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater was sampled and analyzed during 1993 from wells monitoring the following locations in R Area: Well cluster P20 east of R Area (one well each in the water table and the McBean formation), the R-Area Acid/Caustic Basin (the four water-table wells of the RAC series), the R-Area Ash Basin/Coal Pile (one well of the RCP series in the Congaree formation and one in the water table), the R-Area Disassembly Basin (the three water-table wells of the RDB series), the R-Area Burning/Rubble Pits (the four water-table wells of the RRP series), and the R-Area Seepage Basins (numerous water-table wells in the RSA, RSB, RSC, RSD, RSE, and RSF series). Lead was the only constituent detected above its 50 μg/L standard in any but the seepage basin wells; it exceeded that level in one B well and in 23 of the seepage basin wells. Cadmium exceeded its drinking water standard (DWS) in 30 of the seepage basin wells, as did mercury in 10. Nitrate-nitrite was above DWS once each in two seepage basin wells. Tritium was above DWS in six seepage basin wells, as was gross alpha activity in 22. Nonvolatile beta exceeded its screening standard in 29 wells. Extensive radionuclide analyses were requested during 1993 for the RCP series and most of the seepage basin wells. Strontium-90 in eight wells was the only specific radionuclide other than tritium detected above DWS; it appeared about one-half of the nonvolatile beta activity in those wells.

10923 (WSRC-TR–94-0491) **H-Area Acid/Caustic Basin groundwater monitoring report. Third quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005893. Source: OSTI; NTIS; GPO Dep.

During third quarter 1994, samples collected from the four HAC monitoring wells at the H-Area Acid/Caustic Basin were analyzed for selected heavy metals, herbicides/pesticides, indicator parameters, major ions, radionuclide indicators, and other constituents. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during third quarter are the focus of this report. Tritium exceeded the final PDWS in all four HAC wells during third quarter 1994. Carbon tetrachloride exceeded the final PDWS in well HAC 4. Aluminum exceeded its Flag 2 criterion in all four HAC wells. Iron was elevated in wells HAC 1, 2, and 3. Manganese exceeded its Flag 2 criterion in well HAC 3, and total organic halogens was elevated in well HAC 2. No well samples exceeded the SRS turbidity standard. Groundwater flow direction in the water table beneath the H-Area Acid/Caustic Basin was to the northwest during third quarter 1994. This data is consistent with previous quarters, when the flow direction has been to the northwest or the north-northwest.

10924 (YJT–94-11) **Fracture zone analysis of borehole data in three crystalline rock sites in Finland - the principal component analysis approach.** Korkealaakso, J. (VTT Communities and Infrastructure, Espoo (Finland)); Vaittinen, T.; Pitkaenen, P.; Front, K. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Jul 1994. 80p. Order Number DE95621074. Source: OSTI; NTIS; INIS.

In Finland three crystalline rock sites (Romuvaara, Kivetty and Olkiluoto) have been selected for detailed site investigations of Teollisuuden Voima Oy (TVO) for the disposal of the high level waste. The objective of the work has been to study the possibilities of applying the principal component analysis (PCA) of single borehole data to the identification and classification of hydrogeologically important fracture zones. The fracture zone index (FZI) is defined as the first principal component of data from the hydraulic conductivity of 31 m tests, resistivity loggings, radar reflections, open and filled fracture observations and gamma-gamma density/P-wave velocity loggings. FZI anomalies have been compared against earlier conceptualizations based on the overall expert opinion of geological, geophysical and geohydrological information. (42 refs., 49 figs.).

10925 (YJT–94-14) **INTRAVAL project phase 2. Analysis of STRIPA 3D data by a deconvolution technique.** Ilvonen, M. (VTT Energy, Espoo (Finland)); Hautojaervi, A.; Paatero, P. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Sep 1994. 68p. Order Number DE95621022. Source: OSTI; NTIS; INIS.

The data analysed in this report were obtained in tracer experiments performed from a specially excavated drift in good granite rock at the level of 360 m below the ground in the Stripa mine. Tracer transport paths from the injection points to the collecting sheets at the tunnel walls were tens of meters long. Data for six tracers that arrived in measurable concentrations were elaborated by different means of data analysis to reveal the transport behaviour of solutes in the rock fractures. Techniques like direct inversion of the data, Fourier analysis, Singular Value Decomposition (SVD) and non-negative least squares fitting (NNLS) were employed. A newly developed code based on a general-purpose approach for solving deconvolution-type or integral equation problems, Extreme Value Estimation (EVE), proved to be a very helpful tool in deconvolving impulse responses from the injection flow rates and break-through curves of tracers and assessing the physical confidence of the results. (23 refs., 33 figs.).

10926 (YJT–94-15) **Summary report of the experiences from TVO's site investigations.** Oehberg, A. (Saanio and Riekkola Consulting Engineers, Helsinki (Finland)); Saksa, P.; Ahokas, H.; Ruotsalainen, P.; Snellman, M. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Sep 1994. 96p. Order Number DE95621075. Source: OSTI; NTIS; INIS.

In 1992 Teollisuuden Voima Oy (TVO) completed preliminary site investigations for radioactive waste disposal at five sites in Finland. The aim of this report was the compilation of the experiences from TVO's site investigations. The main interest was focused on investigation strategies and the most important investigation methods for the conceptual modelling. The objective of the preliminary site investigations was to obtain data on the bedrock properties in order to evaluate the areas. The programme was divided into four stages, each stage having its own subobjective. The site-specific investigation programme for each site included a large common part and a small site-specific part. The strategies (objectives) and

experiences from different disciplines, geology, hydrogeochemistry, geophysics and geohydrology, are presented in the report. The conceptual modelling work procedure including both bedrock and groundwater modelling is described briefly using the Olkiluoto site as an example. Each of the other areas has undergone similar phases of work. (52 refs., 45 figs., 5 tabs.).

10927 (CONF-920128–1) **Gulf stream frontal eddy influence on productivity of the southeast U.S. continental shelf.** Lee, T.M. (Univ. of Miami, FL (United States)); Yoder, J.; Atkinson, L. Miami Univ., FL (United States). Rosenstiel School of Marine and Atmospheric Sciences. Jan 1991. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER60355. From 6. American Geophysical Union ocean sciences meeting; New Orleans, LA (United States); 27-31 Jan 1992. Order Number DE95005817. Source: OSTI; NTIS; GPO Dep.

Weekly period meanders and eddies are persistent features of Gulf Stream frontal dynamics from Miami, FL, to Cape Hatteras, NC. Satellite imagery and moored current and temperature records reveal a spatial pattern of preferred regions for growth and decay of frontal disturbances. Growth regions occur off Miami, Cape Canaveral and Cape Fear due to baroclinic instability, and decay occurs in the confines of the Straits of Florida between Miami and Palm Beach, between 30° and 32°N where the Stream approaches the topographic feature known as the Charleston bump and between 34°N and Cape Hatteras. Eddy decay regions are associated with elongation of frontal features, offshore transport of momentum and heat and onshore transport of nutrients. Onshore transport of new nitrogen from the nutrient bearing strata beneath the Gulf Stream indicates that frontal eddies serve as a "nutrient pump" for the shelf. Annual carbon production on the shelf due to Gulf Stream input is estimated at 7×10^{12} g C year^{-1} or about 7 million tons carbon per year. Seasonal carbon cycles are estimated for the outer, mid and inner shelf regions from Gulf Stream nutrient input, carbon production, and carbon export.

10928 (CONF-9405279–1) **Measuring stress: Uses and limitations.** Suter, G.W. II (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.). Oak Ridge National Lab., TN (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Extent significance, and policy implications of global marine environmental change conference; Durham, NH (United States); 15-17 May 1994. Order Number DE95006628. Source: OSTI; NTIS; GPO Dep.

The topic of the uses and limitations of measuring stress in the oceans is addressed. The use of the term stress in this context is ambiguous. Rather than assuming that stress is an actual measurable property of oceans, one may assume that the term refers to the complex of harmful things that is going on in the oceans. that is, it is a cover term for a complex of processes and states, many of which are unknown or undefined. The appeal of the term stress used in that way is very tempting. Considerable complexity results from the fact that the ocean consists of numerous and diverse species and ecosystems each of which have various properties that have some claim to protection. Another source of complexity is the diversity of factors which constitute threats to the environment. In evaluating the concepts of ecological risk assessment, there are sources of hazardous agents, there are receptors that are affected, and there is a process by which these interact termed exposure. As a result of exposure there is some probability that the actions of the sources have caused or will cause some effect on the receptor, the risk. Assessments may be source driven; they may attempt to determine the risks associated with a waste outfall. Assessments may also be effects driven; they may attempt to determine the cause of a die-off of marine mammals or determine the likelihood of a particular rise in sea-level. Finally, they may be exposure driven. Each of these components of the causal chain might serve as measures of stress.

10929 (DOE/BP/21416–2) **Phase 2 Water Rental Pilot Project: Snake River resident fish and wildlife resources and management recommendations.** Stovall, S.H. Idaho Dept. of Fish and Game, Boise, ID (United States). Aug 1994. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP21416. Order Number DE95004892. Source: OSTI; NTIS; GPO Dep.

The Idaho Water Rental Pilot Project was implemented in 1991 as part of the Non-Treaty Storage Fish and Wildlife Agreement between Bonneville Power Administration and the Columbia Basin Fish and Wildlife Authority. The goal of the project is to quantify resident fish and wildlife impacts resulting from salmon flow augmentation releases made from the upper Snake River Basin. Phase I summarized existing resource information and provided management recommendations to protect and enhance resident fish and wildlife habitat resulting from storage releases for the I improvement of an adromous fish migration. Phase II includes the following: (1) a summary of recent biological, legal, and political developments within the basin as they relate to water management issues, (2) a biological appraisal of the Snake River between American Falls Reservoir and the city of Blackfoot to examine the effects of flow fluctuation on fish and wildlife habitat, and (3) a preliminary accounting of 1993–1994 flow augmentation releases out of the upper Snake, Boise, and Payette river systems. Phase III will include the development of a model in which annual flow requests and resident fish and wildlife suitability information are interfaced with habitat time series analysis to provide an estimate of resident fish and wildlife resources.

10930 (DOE/ER/61019–T1) **Thermohaline circulations and global climate change. Final report.** Hanson, H.P. Colorado Univ., Boulder, CO (United States). Sep 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61019. Order Number DE95006400. Source: OSTI; NTIS; GPO Dep.

This research is ultimately concerned with investigating the hypothesis that changes in surface thermal and hydrological forcing of the North Atlantic, changes that might be expected to accompany CO2-induced global warming, could result in ocean-atmosphere interactions' exerting a positive feedback on the climate system. This report concerns research conducted with funding from the Carbon Dioxide Research Program (now the Global Climate Change Program) of the US Department of Energy via grant no. DE-FG02-90ER61019 during the period 15 July 1990 - 14 July 1994. This was a three-year award, extended to a fourth year (15 July 1993 - 14 July 1994) via a no-cost extension. It is important to emphasize that this award has been renewed for an additional two years (15 July 1993 - 14 July 1995) via grant no. DE-FG03-93ER61646 (with the same title). Because the project was originally envisioned to be a five-year effort, many of the important results and conclusions will be available for the Final Report of that second award. This report therefore concerns mainly preliminary conclusions and a discussion of progress toward understanding the central hypothesis of the research.

10931 (DOE/ER/61053–T2) **U.S Department of Energy contract DE-FG02-90ER61053: Simulations of the carbon cycle (Part II).** Anderson, T.R. (James Rennell Centre for Ocean Circulation, Chilworth, Southhampton (United Kingdom)); Fasham, M.J.R. Natural Environment Research Council, Swindon (United Kingdom). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61053. Order Number DE95005570. Source: OSTI; NTIS; GPO Dep.

The marine biota are intimately involved in the cycles of nutrients and carbon in the ocean. Photosynthesis by phytoplankton consumes CO_2, incorporating it in organic matter. Some of this is subsequently transported to depth (e.g. by sinking particles) - the so-called "biological pump" which sequesters carbon from surface waters into the large reservoir provided by the ocean interior. The growth of marine phytoplankton tends, however, to be limited by nutrients such as nitrogen. This nutrient limitation must be included in ecosystem models and the currency of most existing ecosystem models is therefore nitrogen. It was for this reason that the work carried out under part I of this contract focussed on developing a simple seven-compartment model of nitrogen cycling in the ocean

mixed layer. This model was subsequently embedded in the Princeton 3D seasonal GCM of the North Atlantic. The results from this work have now been published and will be discussed more fully in the final project report written by Prof. J. Sarmiento and his co-workers. Having developed a suitable nitrogen-based model the next step was to add carbon to the model. A simplistic approach to studying carbon dynamics would be to use the nitrogen-based model, and multiply the flows by a fixed carbon to nitrogen (C:N) ratio. Biological processes are, however, complex. In order to properly investigate the role of the marine biota in the carbon cycle it is necessary to consider the complex interactions which occur between carbon and other elements such as nitrogen. A coupled carbon- nitrogen ecosystem model is described here, which was developed from an existing nitrogen-based model. The model specifically addresses some of the problems particularly associated with the cycling of carbon in the upper ocean and was designed to be suitable for embedding in General Circulation Models (GCMs) to investigate the carbon cycle on a large scale.

10932 (DOE/ER/61053–T3) **Simulations of the carbon cycle in the oceans.** Natural Environment Research Council, London (United Kingdom). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61053. Order Number DE95005571. Source: OSTI; NTIS; GPO Dep.

This report describes simulations of oceanic carbon dioxide uptake, and discusses the relationship between oceanic uptake and anthropogenic greenhouse gases. In addition, evaluation of a 3D North Atlantic simulation model on oceanic nitrogen cycle was discussed and modifications to a first version of a coupled, nitrogen-carbon ecosystem model are presented briefly.

10933 (DOE/ER/61078–T2) **Field, laboratory, and modeling studies of water infiltration and runoff in subfreezing snow on regional scales to estimate future greenhouse-induced changes in sea-level. Final report.** Colorado Univ., Boulder, CO (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61078. Order Number DE95006413. Source: OSTI; NTIS; GPO Dep.

The current DOE-supported research program (Reduce Uncertainty in Future Sea-Level Change Due to Ice Wastage) addressed the question of how the refreezing of meltwater in cold snow affects sea-level changes in a future changing climate. The continuation of that research, proposed here, takes an additional new approach by focusing on processes which can be defined and characterized by measurements on regional scales. This new emphasis is intended to be directly applicable to a large-scale analysis from which runoff forecasts (and consequent sea level change) from the entire arctic region can be made. The research proposed here addresses the problem of forecasting future sea-level change due to greenhouse-induced changes in runoff from polar glaciers and ice caps. The objectives of this work are (1) to observe in the field the processes of infiltration and refreezing which lead to the formation of impermeable firn layers; (2) to reproduce these observed processes in the laboratory to confirm and further quantify their understanding; (3) to develop and calibrate a regional scale numerical model which can simulate these processes, based on measured parameters and driven by boundary conditions determined by climate; and (4) to apply this model to predict the development of impermeable firn (and consequent runoff and discharge to the ocean) in response to predicted future climate change.

10934 (DOE/ER/61119–T2) **Ocean Studies Board annual report, 1991.** National Academy of Sciences, Washington, DC (United States). Ocean Studies Board. 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER61119. Order Number DE95005490. Source: OSTI; NTIS; GPO Dep.

The Ocean Studies Board (OSB), created in July, 1985, serves as an independent advisor to the federal government on matters of ocean science and policy. The goals of the Ocean Studies Board are: to promote the advancement of scientific understanding of the ocean by overseeing the health of ocean sciences and stimulating their progress; to encourage the wise use of the ocean and its resources through the application of scientific knowledge; to lead in the formulation of national and international marine policy and to clarify scientific issues that affect this policy; and to promote international cooperation in oceanographic research and to improve scientific and technical assistance to developing countries. The Ocean Studies Board is a multi-disciplinary body with representation from the fields of marine biology and biological oceanography, chemical oceanography, physical oceanography, marine geology and geophysics, engineering, and marine policy. This report reviews existing projects and discusses the progress of ocean research programs.

10935 (DOE/EW/53023–T9) **Hazardous materials in aquatic environments of the Mississippi River Basin. Quarterly project status report, October 1, 1994–December 31, 1994.** Tulane Univ., New Orleans, LA (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EW53023. Order Number DE95006414. Source: OSTI; NTIS; GPO Dep.

This report briefly summerizes the following projects on hazardous materials in the aquatic environments of the Mississippi River Basin: Biotic and abiotic studies on the biological fate, transport and ecotoxicity of toxic and Hazardous waste in the Mississippi River Basin; The effect of depositional environment on the fate and transport of contaminants in aquatic environments;Assessment of mechanisms of metal-induced reproductive toxicity in aquatic species as biomarkers of exposure; Hazardous wastes in aquantic environments: biological uptake and metabolism studies; bioremediation of selected contaminants in aquatic environments of the Mississippi River Basin; Development of Novel dechlorination catalysts; pore-level flow, transport, agglomeration and reaction kinetics of microorganisms; novel polymer-semiconductor composits for photocatalytic destruction of organic contaminants in aqueous environments; biomarkers of exposure and ecotoxicity in the Mississippi River Basin; Natural and Active Chemical remediation cluster; collaborative research with the Institute of Radiological Problems (IREP) - fate and transport of radionuclides following the Chernobyl Accident; Exper geographical information systems for assessing hazardous wastes in aquatic environments; computation of Taylor Dispersion coefficient.

10936 (ENEA-RT-AMB–94-25) **Application of collinear tracks method to analyse ers-1 altimeter data for mapping contouring lines of Rms variability.** Lisca, A. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa); Vignudelli, S. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. Nov 1994. 35p. (RT/AMB–94-25). Order Number DE95749729. Source: OSTI; NTIS (US Sales Only).

ERS-1 altimeter data, acquired during a 6-month period over the Mediterranean sea, have been presented using the collinear tracks method. This area is well known for its interesting current systems characterized by quite stable circulation loops (e.g. in the Northwestern regions) and unstable dynamics (e.g. the Algerian current). The investigation has focused on the elimination of the radial orbit errors by means of the linear regression method. The variations of surface height in the Mediterranean sea are of limited amplitude. Therefore it is necessary to apply accurate data corrections. In the present report we describe algorithms of correction which include also the results of a tide model of the Mediterranean sea for OPR02(ocean products) CERSAT products. Up until the last few years altimeter data from satellites were not corrected for the tide effects in closed seas. The method consists of an alignment of collinear tracks, a cubic spline interpolation to obtain data on a regular grid, a mean removal and a linear trend removal. We repeatedly applied this step by step mode for data from all tracks crossing the Mediterranean sea and produced contour maps of the Rms 3 variability.

10937 (GSF–19/94) **Elucidation of processes resulting in the contamination of groundwater used as drinking water reservoirs with pesticides.** Doerfler, U. (GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Bodenoekologie); Schroll, R.; Scheunert, I. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Aug 1994. 220p. (In German). Order Number DE95746401. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the partial project was the long-term measurement of the transfer of ^{14}C-labelled pesticides and, especially, their conversion and degradation products from soils into leachate upon application under field conditions according to current practice. Consequently, experiments in lysimeters were carried through where ^{14}C-labelled terbutylazine and pendimethaline were applied to sandy arable soil (NM) and sandy forest soil (SF). The arable soil bore culture plants and the forest soil had been planted with forest grasses. Not only were radioative products in leachate quantified and characterized, but, in addition, measurements for making up a ^{14}C budget in the terrestrial ecosystem were carried through including the determination of residues in the soil, uptake by plants, volatilization into the atmosphere, and mineralization to $^{14}CO_2$. (orig.)

10938 (INIS-mf–14471, pp. 17-19) **Water quality control determination of gross alpha and gross beta radioactivity in drinking water in Israel.** Even, O. (Israel Atomic Energy Commission, Yavne (Israel). Soreq Nuclear Research Center); Margaliot, M.; Shamai, Y.; Schlesinger, T. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

The quality of measuring results and the correctness of estimations based on them are essentially determined by the quality of sampling. Therefore it must be assured by careful sampling performed by well trained personnel that representative and comparable samples are taken at the different sampling places. Important influential factors for sampling points and samples themselves have to be determined and documented during sampling. Attention has to be paid above all to a clear description of the sampling place and sampled material and to an unmistakable labelling of the sample. (orig./DG)

10940 (INIS-mf–15085, pp. 141-148) **Sample preparation of drinking, ground and waste water as well as of sewage sludge, residual materials and wastes.** Buenger, T. Source: OSTI; NTIS (US Sales Only); INIS.

The primary objective of the preparation of water and sewage sludge samples consists in reducing the volume of the sample aimed at increasing their activity concentration or specific activity, that means the radionuclide(s) to be determined are to be enriched in the sample in order to reduce the detection limit. As a rule, a simplified preparation procedure may be used, such as evaporation of water samples, drying of sludge samples, because the determination of nuclides by means of gamma spectroscopy is performed parallely and undisturbedly. It is also usual to combine different preparation procedures, e.g. to evaporate a water sample converting it into a measuring preparation in filter geometry for gamma spectroscopy, and further converting it into an yttrium-90 measuring preparation in order to determine strontium-90 via the daughter nuclide. (orig./DG)

10941 (INIS-mf–15090) **Report on the 1992 study trip on the Weser aboard the laboratory ship 'Max-Pruess' of the Land North-Rhine-Westfalia.** Arbeitsgemeinschaft der Laender zur Reinhaltung der Weser, Bremen (Germany). [1993]. 125p. (In German). Order Number DE95746669. Source: OSTI; NTIS (US Sales Only); INIS.

As agreed by the standing committee of the Weser task force ('Arge Weser'), regular trips on the river for taking measurements have been made since 1965. The ninth trip, from May 8th to 14th, 1992 aboard the "Max Pruess", a ship equipped with measuring instruments and a laboratory and owned by the Land North-Rhine-Westphalia, was concerned with three areas of investigation: (A) the Fulda and Werra estuaries, (B) the upper and middle Weser (Hann.-Muenden (km 0.0) to Bremen (km 361.1)), (C) the lower Weser (Bremen (km 0.0) to Kolumbuskai (km 67.8)). A uniform water quality longitudinal profile of the Weser was established during this trip by means of chemico-physical and biological tests. While investigations by measuring stations cover a longer period of time, the measurements taken during a voyage reflect a transient condition and complement long-term trend investigations. The voyage also permits to gain an overview of relative changes in the condition of the river at various points of its course. The evaluation of the results of this trip is facilitated by investigations of Arge Weser already carried through for the duration of several years and information obtained by previous trips. (orig./EF)

10942 (INIS-mf–15094) **The distribution of heavy metals in the sediments of a basin of the harbour of Bremen.** Berichte aus dem Fachbereich Geowissenschaften der Universitaet Bremen, v. 34. Kasten, S. Bremen Univ. (Germany). Fachbereich 5 - Geowissenschaften. 1993. 120p. (In German). Order Number DE95746685. Source: OSTI; NTIS (US Sales Only); INIS.

The tide-exposed basins of the harbour of Bremen have a strong tendency to silt up due to the very low flow velocities in this area. This means that 700,000 m^3 of silt have to be excavated every year to maintain nautical depths. The harbour slush, which is heavily charged with heavy metals (Cd, Cr, Cu, Ni, Pb, Zn) amongst other pollutants, poses a considerable environmental hazard, whether through its accomodation in flushing fields or, as planned for the future, on spoil dumps or through its presence in the water. To estimate this hazard it was necessary to determine the degree of contamination of the harbour sediment. In doing so, it had to be taken into account that there can be great variations in the spatial distribution of heavy metals in the sediment in some cases and that the heavy metal content of submerged solids can also fluctuate with time: With regard to statements on the ecological situation and to questions of pollutant mobility it was also of decisive importance to know about the bond types of the heavy metals in the sediment. (orig./BBR)

10943 (KFK–5388) **Estimating by a dynamic compartment model the activity concentration and radiation exposure after**

discharge of radionuclides into the coastal waters of Northwest Europe. Kazakis, I. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Maschinenbau. Oct 1994. 139p. (In German). Order Number DE95752104. Source: OSTI; NTIS (US Sales Only); INIS.

A dynamic compartment model is presented here which serves to determine the activity distribution in the coastal waters of Northwest Europe. The media considered are water, suspended matter, particulates of biological origin and sediment. The model is validated by calculation of the activity distribution of Cs-137 from the La Hague and Sellafield reprocessing plants for the period from 1956 until 1985. The Cs-137 activity concentrations determined in this way are compared with measured values. Finally, the radiation exposure of the critical group of the population is calculated on the basis of the releases from the reprocessing plants. (orig.)

10944 (KFK–5401) **Corrosion experiments of potential construction materials for the supercritical water oxidation of hazardous waste at 500 C, 270 bar.** Glasbrenner, H.; Kraft, R.; Leistikow, S.; Casal, V.; Gegenheimer, M.; Schmidt, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Angewandte Thermo- und Fluiddynamik (IATF); Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Schadstoff- und Abfallarme Verfahren (PSA). Oct 1994. 64p. (In German). Order Number DE95755520. Source: OSTI; NTIS (US Sales Only).

Different metallic materials were exposed in a refreshed autoclave system to oxygen containing supercritical water (500 h, 500 C, 270 bar) to evaluate basically their general corrosion behavior when applied as pressure tube material within an oxidation waste destruction process. Thus seventeen coupons consisting of CrNi steels, nickel base alloys, various reactive metals, and six differently coated Inconel 600 specimens were tested. The best behavior was shown by the Nickel base alloys and the hot-dip aluminium coated Inconel 600 specimens. (orig.)

10945 (LA-UR–94-4225) **A test of aquatic macroinvertebrate sub-sampling using a gridded screen.** Cross, S.P. Los Alamos National Lab., NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505161–1: North American Benthological Society conference, Keystone, CO (United States), 30 May - 2 jun 1995). Order Number DE95005159. Source: OSTI; NTIS; GPO Dep.

The Biological Resource Evaluations Team of Los Alamos National Laboratories assessed the reliability of a gridded screen sub-sampling technique to estimate aquatic macroinvertebrates in total samples. Benthic macroinvertebrates were collected by kick sampling three riffles areas in Guaje Canyon, Los Alamos County, New Mexico during July and August, 1994. The study included 4,144 macroinvertebrates from samples consisting of 442 to 1005 individuals. The entire samples were spread onto a gridded screen, and 100 macroinvertebrates were randomly selected for identification. To simplify the results, identified macroinvertebrates were assigned to one of six categories: plecoptera, ephemeroptera, trichoptera, coleoptera, diptera, and non-insects. Three sub-samples were taken from each of six full samples. These counts were used as predicted values, while the total sample counts were used as actual values. Single-factor ANOVA tests showed no significant differences between predicted to actual (PTA) values. However, PTA differences indicated that lab-sorting was a more reliable method than live-sorting without a narcotizing agent. Large samples and large numbers in macroinvertebrate categories were tentatively linked with greater PTA differences. PTA differences were less than 5% in 80% of our trials and less than 10% in 95% of our trials. Despite the relatively small size of sub-samples, sub-samples included 60% of taxa found in the total samples. This sub-sampling technique provides accurate estimates of total sample composition in stream reaches rich enough to easily yield the required 100 individuals.

10946 (PNL–2813) **Biocide by-products in aquatic environments. Quarterly progress report, April 1, 1978–June 30, 1978.** Anderson, D.R.; Bean, R.M.; Gibson, C.I. Pacific Northwest Lab., Richland, WA (United States). Nov 1978. 37p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005807. Source: OSTI; NTIS; GPO Dep.

We are continuing to make progress in the analytical chemistry and biological effects phases of our study of chlorination by-products. As noted in earlier quarterly reports, the schedule of work for this year has been revised so that tasks originally scheduled for the fourth quarter of the year will continue into the first quarter of FY 1979. Additional chlorination by-products have been detected in the analytical task, and bioassays are continuing in the biological tasks. In Task 1, detailed analytical data have been obtained on the organohalogen contents of chlorinated freshwater (Columbia River) and seawater (Sequim Bay) systems. Samples have been characterized with respect to: (1) type and quantity of haloform produced from chlorination; (2) total organohalogen produced; (3) distribution of organohalogen by molecular weight; and (4) distribution of organohalogen by polarity. In addition, a number of samples have been examined for individual halogenated components. Trout tissues from the freshwater chlorination exposure system have been screened for chloroform.

10947 (SA-PUB–1/94, pp. 140-145) **Impact of climate change on carbon cycle in freshwater ecosystems.** Kankaala, P. (Helsinki Univ., Lammi (Finland). Lammi Biological Station); Ojala, A.; Arvola, L.; Tulonen, T. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The aim of this study is to produce an ecosystem model, which can be used to predict the effects of climate change on freshwater ecosystems. In this study (1993-1995) the main emphasis is to study experimentally the impacts of increasing CO_2 concentration, temperature, nutrient and DOM load on the littoral ecosystem.

10948 (SLU-MIKRO-R–94-1) **Adaption of denitrification bacteria to the external coal sources acetate and methanol in an activated sludge process.** Hallin, S.; Pell, M. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Microbiology. 1994. 27p. (In Swedish). Order Number DE95744963. Source: OSTI; NTIS.

Examination paper.

Adaption of activated sludge to the organic compounds acetate and methanol has been studied in laboratory scale under pre- and post-denitrification conditions. The examined systems were fed with wastewater, methanol or acetate and nitrate every second day during 54 days. The incubation was done in anaerobic and aerobic cycles. The potential denitrification rate with the organic compound and the amount of bacteria able to denitrify with the compound was followed during the experiment to study how adaptation to the carbon source was achieved. The rate was measured with the acetylene block technique and bacteria were counted by using the most-probable-number (MPN) method. The experiment showed that the addition of an external carbon source lead to an increased denitrification rate in all the examined conditions except from when acetate was used in pre-denitrification with sewage containing a high level of decomposable organic compounds. The adaption to acetate or methanol was mainly due to an increased amount of bacteria with high activity. The competition between different populations continued after a maximal potential rate of denitrification was reached. The denitrification rate with butyric acid and glucose increased in the pre-denitrification systems adapted to methanol or acetate in comparison with the control. The sludge in the post-denitrification system lost its capability to denitrify with other compounds than the system had been adapted to. When methanol was used as an external carbon source a lag period was needed before the rate of denitrification increased. Methanol is therefore not recommended if the external organic carbon is only to be used under certain periods. For continuous use of a carbon- and energy source methanol is very useful because the bacteria using methanol will not compete with the bacteria using the energy in sewage. 21 refs, 14 figs, 3 tabs

10949 (SNV–4374) **The Forsmark biotest basin. An instrument for environmental research. Experiences of large cooling water discharges in Sweden (1969-1993) and research perspectives for the future.** Snoeijs, P. Swedish Environmental Protection Agency, Solna (Sweden). 1994. 73p. Order Number DE95620007. Source: OSTI; NTIS; INIS.

This report presents the Biotest basin at Forsmark (Sweden) as an instrument for experimental environmental research, and indicates possibilities for its future use. the basin consists of a 1 km^2 artificial enclosure in the Baltic Sea that receives cooling water discharge from the Forsmark nuclear power plant. Cooling water discharge was initiated in 1980, and since then the basin has been serving as the main Swedish instrument for field studies on the effects of enhanced temperature and low-dose radioactivity on aquatic ecosystems. Environmental effects of large cooling water discharges from power plants to the sea have been studied at other sites in Sweden too, and for the sake of completeness of background information this report provides a survey and an extensive bibliography of all previous research on cooling water discharges in Sweden during the last 25 years. The aim of scientific research in the Biotest basin is to provide an independent academically-based assessment of the effects of the discharges of heat to the aquatic environment and of the pathways of pollutants through the ecosystems. Until now the research has mainly been describing the ecological effects of the cooling water flow through the basin under normal operation of the power plant. In the future it will be possible to manipulate the basin for large field experiments. An important perspective for the future is that of climatic change; the Forsmark Biotest basin provides excellent conditions for field studies on possible biological effects. This includes e.g. temperature effects on basic biological processes (growth, metabolism, reproduction etc.), population genetics, and combination effects of heat and toxic substances. 60 refs, 3 figs, 6 tabs.

10950 (WHC-SD-WM-PLN–071) **384 Power plant waste water sampling and analysis plan.** Hagerty, K.J.; Knotek, H.M. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005142. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the 384 Power House Sampling and Analysis Plan. The Plan describes sampling methods, locations, frequency, analytes, and stream descriptions. The effluent streams from 384, were characterized in 1989, in support of the Stream Specific Report (WHC-EP-0342, Addendum 1).

10951 (YJT–94-03) **Simulation of the groundwater flow of the Kivetty area.** Taivassalo, V. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Meszaros, F. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Feb 1994. 156p. Order Number DE95621099. Source: OSTI; NTIS; INIS.

Teollisuuden Voima Oy (TVO) is preparing for the final disposal of spent nuclear fuel into crystalline bedrock in Finland. Groundwater flow modelling is a part of the preliminary site investigation work. The aim is to simulate groundwater flow as realistically as possible in view of the experimental data available. Three dimensional groundwater flow modelling is based on a conceptual bedrock model. The modelling results will be used in the site evaluation process. Observations from flow simulations will also be used to identify and study uncertainties included in the site characterization. First a conceptual flow model for the Kivetty site in Konginkangas was developed. As a second stage the flow model was calibrated. The goal was to increase the reality of the model. To evaluate the reality of the flow model, the values of the input and output parameters were compared with the field data. Finally groundwater flow simulation results were computed and groundwater flow at the Kivetty area was analysed. (50 refs., 78 figs., 7 tabs.).

10952 (LA-SUB–95-2) **1994 Northern Goshawk inventory on portions of Los Alamos National Laboratory, Los Alamos, NM.** Sinton, D.T. (Colorado State Univ., Fort Collins, CO (United States)); Kennedy, P.L. Los Alamos National Lab., NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005727. Source: OSTI; NTIS; GPO Dep.

Northern goshawks (Accipiter gentilis) (hereafter referred to as goshawk) are large forest dwelling hawks. They are the largest species of the Accipiter genus which also includes sharp-shinned hawks (A. striatus) and the Cooper's hawk (A. cooperii). Goshawks are holarctic in distribution and nest in coniferous, deciduous, and mixed species forests. In the southwest they primarily nest in ponderosa pine (Pinus ponderosa), mixed species, and spruce-fir forests. Goshawks may be declining in population and reproduction in the southwestern United States. In 1982 the USDA-Forest Service listed the goshawk as a "sensitive species" and in 1992 the U.S. Fish and Wildlife Service listed the goshawk as a "Category 2 species" in accordance with the Endangered Species Act. Reasons for the possible decline in goshawk populations include timber harvesting resulting in the loss of nesting habitat, toxic chemicals, and the effects of drought, fire, and disease. Thus, there is a need to determine their population status and assess impacts of management activities in potential goshawk habitat. Goshawk inventory was conducted during the 1993 nesting season with no adult goshawk responses detected within the LANL survey area. As noted by Sinton and Kennedy, these results may be interpreted in several ways: (1) no goshawk territory(ies) occur in the inventoried area; (2) goshawk territory(ies) exist but have failed prior to the survey and thus were not detected; or (3) territory(ies) exist and were successful but the goshawks did not respond to tapes or their responses were undetected by the observer. For those reasons, a goshawk inventory was conducted in 1994. This report summarizes the results of this inventory.

10953 (PNL-SA–25324) **Russian perspectives: The past shapes the present.** Houck, R.P. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411175–1: United States industrial coalition meeting, Washington, DC (United States), 17-18 Nov 1994). Order Number DE95004905. Source: OSTI; NTIS; GPO Dep.

This document contains an outline of a speech given to a group of professionals at Pacific Northwest Laboratory which was intended to give an unbiased view of Soviet perceptions. Topics discussed include: The new mission of US and Soviet labs and institutions to develop products and dedicate research to post cold war threat, historical prospectives of Russia, Russian military roles and missions, ideology of Russian politics, evils of capitalism, Russian civil war, communism, world war II, Russian losses during the war, the cold war, reasons why America should care what happens in Russia, the internal threat against a market-based economy, the US should help, and the Russian people and their attitudes.

10954 (ANL/CMB/PP–83169) **Use of labeled primers for differential display.** Paunesku, T.; Woloschak, G.E. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005830. Source: OSTI; NTIS; GPO Dep.

The differential display of eukaryotic cDNAs using PCR allows for determination of mRNA species differentially expressed when comparing two similar cell populations. This procedure uses a $(T)_{12}XY$ oligonucleotide as the 3 ft primer and an arbitrary 8-10-mer as the 5 ft primer. Labeling occurs by inclusion of $\alpha[^{33}P]$-dATP in the PCR reaction. Two artifacts caused by this approach are (1) random printing from dT present from affinity purification of PolyA+RNA and (2) hybridization of the arbitrary primer to template target sequences on both cDNA strands. In this work, we have developed an approach for both eliminating smearing and identifying

nonspecific bands on sequencing gels. By separately using 5 ft-end-labeled $(T)_{12}XY$ and arbitrary primers to label bands and comparing two differential display patterns rather than including labeled nucleotides in the PCR reaction itself, we can detect only those products incorporating the $M_{12}XY$ primer on the 3 ft ends and the arbitrary primer on 5 ft ends. Those bands that are generated randomly in the PCR reaction are readily detectable and can be ignored. If on the other hand, one is interested only in a diagnostic banding pattern for differential display, benefit can be derived from the simplicity of the pattern obtained when labeled $(T)_{12}XY$ is used.

10955 (CONF-8808142–Pt.3) **Genetics and the unity of biology.** Genetics Society of America, Bethesda, MD (United States). [1995]. 305p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER60672. From 16. international congress of genetics; Toronto (Canada); 20-27 Aug 1988. Order Number DE95006484. Source: OSTI; NTIS; GPO Dep.

International Congresses of Genetics, convened just once every five years, provide a rare opportunity for overview in the field of genetic engineering. The Congress, held August 20-27, 1988 in Toronto, Canada focused on the theme Genetics and the Unity of Biology, which was chosen because the concepts of modern genetics have provided biology with a unifying theoretical structure. This program guide contains a schedule of all Congress activities and a listing of all Symposia, Workshops and Poster Sessions held.

10956 (CONF-9110552–Absts.) **Third international congress of plant molecular biology: Molecular biology of plant growth and development.** Hallick, R.B. (ed.). International Society for Plant Molecular Biology, Tucson, AZ (United States). [1995]. 421p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER20012. From 3. international congress of molecular biology of plant growth and development; Tucson, AZ (United States); 6-11 Oct 1991. Order Number DE95006482. Source: OSTI; NTIS; GPO Dep.

The Congress was held October 6-11, 1991 in Tucson with approximately 3000 scientists attending and over 300 oral presentations and 1800 posters. Plant molecular biology is one of the most rapidly developing areas of the biological sciences. Recent advances in the ability to isolate genes, to study their expression, and to create transgenic plants have had a major impact on our understanding of the many fundamental plant processes. In addition, new approaches have been created to improve plants for agricultural purposes. This is a book of presentation and posters from the conference.

10957 (CONF-9302203–Summ.) **The Gordon conference on mammalian DNA repair.** Cleaver, J.E.; Smerdon, M.J. Gordon Research Conferences, Inc., Kingston, RI (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG02-93ER61537. From Gordon research conference on mammalian DNA repair; Ventura, CA (United States); 1-5 Feb 1993. Order Number DE95005525. Source: OSTI; NTIS; GPO Dep.

A brief overview of the Gordon Conference on Mammalian Repair held February 1-5, 1993 in Ventura, California is presented.

10958 (CONF-950484–2) **Sequence comparison on a cluster of workstations using the PVM system.** Guan, X.; Mural, R.J.; Uberbacher, E.C. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IPPS 95: parallel processing symposium; Santa Barbara, CA (United States); 25-28 Apr 1995. Order Number DE95006527. Source: OSTI; NTIS; GPO Dep.

We have implemented a distributed sequence comparison algorithm on a cluster of workstations using the PVM paradigm. This implementation has achieved similar performance to the intel iPSC/860 Hypercube, a massively parallel computer. The distributed sequence comparison algorithm serves as a search tool for two Internet servers GRAIL and GENQUEST. This paper describes the implementation and the performance of the algorithm.

10959 (EGG–2744, pp. 193-200) **Pharmacokinetics of borocaptate sodium in canine head determined by ^{11}B magnetic resonance imaging and spectroscopy.** Bradshaw, K.M. (Neutron Technology, Boise, ID (United States)); Schweizer, M.P.; Hadley, J.R.; Glover, G.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

As new boron compounds are introduced for BNCT, requirements to conduct pharmacokinetic studies more quickly and noninvasively will intensify. The purpose of this paper is to present a method for determining the in vivo distribution and kinetics of $Na_2B_{12}H_{11}SH$ (Borocaptate Sodium or BSH) and to monitor its deployment in real time. To obtain pharmacokinetic data in "real time" the method must be non-invasive and fast enough to sample the changing environment. Magnetic Resonance (MR) had been suggested from the beginning as an ideal non-invasive method, but, because of the low signal-to-noise (SNR) for boron imaging (about 10^6 times less than proton imaging) and fast relaxation of the nuclei (less than 1 msec), problems seemed insurmountable. With the advances in MRI technology, a solution has been found that makes the premise of this research feasible. Instead of using two-dimensional chemical shift imaging (2D-CSI) which takes too long to acquire image data, the authors are proposing the use of a three-dimensional (3D) projection reconstruction method. The method meets the necessary requirements of being non-invasive and fast, with data acquisition on the order of minutes instead of hours. To demonstrate the viability of using boron 3D projection reconstruction imaging to conduct pharmacokinetic research, in vivo studies were conducted involving dogs with and without tumors. The BSH uptake and elimination of different tissues types were compared qualitatively by comparing the relative boron MRI signals.

10960 (EGG–2744, pp. 201-208) **Bioavailability of intravenous formulations of p-boronophenylalanine in dog and rat.** LaHaan, T.R. (Idaho State Univ., Pocatello, ID (United States)); Lu, D.R.; Daniell, G.; Sills, C.; Kraft, S.L.; Gavin, P.R.; Bauer, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Boron neutron capture therapy (BNCT) is being developed as a treatment for malignant melanoma. P-boronophenylalanine (BPA) was initially proposed as a boron (B) delivery drug for BNCT of malignant melanoma because it was postulated that this B-containing amino acid, by mimicking a melanin precursor, would selectively accumulate in melanoma cells. BPA does seem to selectively accumulate in melanocytes, apparently as a result of uptake by an amino acid transport system. For successful BNCT, tumor B concentrations of at least 20 ppm are thought to be necessary, but higher tumor B levels are desirable. Calculations indicate that for a given neutron exposure, each doubling of the tumor B concentration should increase tumor cell kill by a factor of about 10,000. Thus, even modest increases in the amount of B in tumor cells can dramatically improve the effectiveness of BNCT as a cancer treatment. The purpose of this work was to (1) determine the extent to which the aqueous solubility of BPA is increased by host-guest complex formation with the cyclodextrin 2-hydroxypropyl-B-cyclodextrin and by organic complex formation with fructose, and (2) test the hypothesis that i.v. formulations which enhance BPA solubility will increase the delivery of B to tissue sites.

This volume of abstracts represents the main publication of the XVIIth International Congress of Genetics. It contains summaries

of: The invited Plenary and symposia papers; abstracts of the Public Awareness presentations; and contributions from delegates. Topics discussed include; genetic engineering and mapping, DNA repair proteins, gene mutations, and gene recombination.

10962 (LA-UR–94-4389) **Ionizing radiation-induced mutation of human cells with different DNA repair capacities.** Amundson, S.A.; Chen, D.J. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by National Insts. of Health, Bethesda, MD (United States). DOE Contract W-7405-ENG-36. (CONF-9407154–2: COSPAR '94, Hamburg (Germany), 11-21 Jul 1994). Order Number DE95005237. Source: OSTI; NTIS; INIS; GPO Dep.

We have observed significant differences in the response to ionizing radiation of two closely related human cell lines, and now compare the effects on these lines of both low and intermediate LET radiation. Compared to TK6, WTK1 has an enhanced X-ray survival, and is also more resistant to cell killing by α-particles. The hprt locus is more mutable in WTK1 than in TK6 by both X-rays and α-particles. WTK1 is also more mutable by α-particles than by X-rays at the hprt locus. X-ray-induced mutation at the heterozygous tk locus in WTK1 is about 25 fold higher than in TK6, while α-particle-induced mutation is nearly 50 fold higher at this locus. Also, the slowly growing tk- mutants, which comprise the majority of spontaneous and X-ray-induced tk- mutants of TK6, were not induced significantly by α-particles. Previously, we showed that TK6 has a reduced capacity for recombination compared with WTK1, and therefore, these results indicate that recombinational repair may contribute to both cell survival and mutation-induction following exposure to ionizing radiation. Such a mechanism may aid cell survival, but could also result in increased deleterious effects such as the unmasking of recessive mutations in cancer suppresser genes.

5505 Metabolism

10963 (CONF-950156–1) **Species differences in metabolism of 1,3-butadiene.** Henderson, R.F. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From 5. international symposium on biological intermediates; Munich (Germany); 3-5 Jan 1995. Order Number DE95006163. Source: OSTI; NTIS; INIS; GPO Dep.

1,3-Butadiene (BD) is a 4-carbon gaseous compound with two double bonds. Used in high tonnage to make styrene-butadiene polymers in the rubber industry. Because of large amounts in use, BD was tested for toxicity in 2-year inhalation exposures of both Sprague-Dawley rats and $B6C3F_1$ mice. The results of the two-species studies were dramatically different. In the initial study in mice, BD was shown to be a potent multiple-site carcinogen at exposure levels of 625 and 1250 ppM. There were increased incidences of neoplasia in the heart, lung, mammary gland, and ovary; malignant lymphomas resulted in early deaths of the mice so that the planned 2-year study was stopped after only 61 weeks of exposure. The second study in mice was conducted at much lower exposure concentrations (6.25, 20, 62.5, 200, and 625 ppM) and lasted 104 weeks. Increased incidences of hemangiosarcomas of the heart and lung neoplasia were observed in males exposed to 62.5 ppM BD, while females had increased lung neoplasia even at the 6.25 ppM exposure level. Early deaths from lymphomas were again observed at the high exposure concentration (625 ppm). A noncancer toxicity observed in mice was a macrocytic, megaloblastic anemia.

10964 (UCRL-JC–116670) **Biological sample preparation and ^{41}Ca AMS measurement at LLNL.** Freeman, S.P.H.T. (Lawrence Livermore National Lab., CA (United States). Center for Accelerator Mass Spectrometry); Southon, J.R.; Bench, G.S.; McAninch, J.E.; Serfass, R.E.; Fang, Y.; King, J.C.; Woodhouse, L.R. Lawrence Livermore National Lab., CA (United States). 10 Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–14: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95006439. Source: OSTI; NTIS; GPO Dep.

Calcium metabolism in biology may be better understood by the use of ^{41}Ca labels, although detection by accelerator mass spectrometry (AMS) is required. Methodologies for preparation of urine samples and subsequent AMS measurement were investigated. Novel attempts at preparing CaH_2 were unsuccessful, but CaF_2 of sufficient purity could be produced by precipitation of calcium from urine as oxalate, followed by separation of calcium by cation exchange chromatography and washing the CaF_2 precipitate. The presence of some remaining impurities could be compensated for by selecting the appropriate accelerated ion charge state for AMS. The use of projectile x rays for isobar discrimination was explored as an alternative to the conventional dE/dx device.

Nickel tetracarbonylporphyrin (NiTCP) and VCDP, a boronated porphyrin, were chemically prepared and injected intraperitionally into mice. Toxicity as measured by hematologic and hepatic indices.

10966 (CONF-950581–1) **Reactor production and processing of radioisotopes for therapeutic applications in nuclear medicine.** Knapp, F.F. Jr.; Mirzadeh, S.; Beets, A.L. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on isotopes (ICI) and exhibition; Beijing (China); 7-12 May 1995. Order Number DE95006750. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear reactors continue to play an important role in providing radioisotopes for nuclear medicine. Many reactor-produced radioisotopes are "neutron rich" and decay by beta-emission and are thus of interest for therapeutic applications. This talk discusses the production and processing of a variety of reactor-produced radioisotopes of current interest, including those produced by the single neutron capture process, double neutron capture and those available from beta-decay of reactorproduced radioisotopes. Generators prepared from reactorproduced radioisotopes are of particular interest since repeated elution inexpensively provides many patient doses. The development of the alumina-based W-188/Re-188 generator system is discussed in detail.

10967 (EGG–2744, pp. 5-42) **The role of chemistry in the development of boron neutron capture therapy of cancer.** Hawthorne, M.F. (Univ. of California, Los Angeles, CA (United States)). Source: OSTI; NTIS; INIS; GPO Dep.

A therapeutic method that selectivity destroys malignant cells in the presence of normal cells is a highly valued goal of oncologists and the possible salvation of cancer patients afflicted with some incurable forms of the disease. Selective cell destruction is, in principle, possible with a binary therapeutic strategy based upon the neutron capture reaction observed with the ^{10}B nucleus and a neutron of low kinetic energy (thermal neutron). This nuclear fission reaction produces both ^{4}He and $^{7}Li^{+}$ nuclei along with about 2.4 MeV of kinetic energy and weak γ-radiation. Since the energetic and cytotoxic product ions travel only about one cell diameter in

tissue one may specify the cell type to be destroyed by placing innocent ^{10}B nuclei on or within only the doomed cells. This article describes the current status of chemical research aimed at the eventual adoption of this therapeutic method (boron neutron capture therapy or BNCT). The multidisciplanary nature of this research effort involves chemistry, biology, nuclear physics, medicine, and related specialities. Methods devised for bringing ^{10}B nuclei to tumor cells in therapeutic amounts are correlated with the structure of a generalized cell and the various cellular compartments available for boron localization. The synthesis methods employed for the creation of boron-containing biomolecules and drugs are presented along with representative data concerning their efficacy in tumor localization. The outlook for BNCT is especially bright at this time because of rapid developments in the fields of bioorganometallic chemistry, microbiology, immunology, and nuclear science, to name but a few. Very effective boron delivery vehicles have been demonstrated, and through the interaction of chemistry and biology these species are undergoing further improvement and evaluation of their suitability for BNCT.

10968 (EGG–2744, pp. 43-53) **Large animal normal tissue tolerance using an epithermal neutron beam and borocaptate sodium.** Gavin, P.R. (Washington State Univ., Pullman, WA (United States)); DeHaan, C.E.; Huiskamp, R.; Wheeler, F.J.; Kraft, S.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Irradiation of the canine head following intravenous $Na_2B_{12}H_{11}SH$ (BSH) administration has provided useful information concerning the tolerance of skin and brain to the resultant complex form of irradiation. The effect of the boron capture reaction in skin and brain has provided estimates of the influence of the microscopic dosimetry involved. Dogs irradiated with the epithermal beam alone provided valuable insight into the relative biological effectiveness (RBE) of the fast neutron component (> 10 keV) of the epithermal beam. When compared with literature values for X-rays for the occurrence of skin necrosis in dogs, an RBE of 4.5 was derived. Previous pharmacokinetic data concerning the distribution of $Na_2B_{12}H_{11}SH$ (BSH) to blood and brain has been used to obtain input parameters for computer models of the microvasculature of the brain. Monte Carlo computer models were used to simulate the microscopic distribution of BSH in the normal brain. The term compound factor describes the product of the microscopic boron fission fragment dose hitting the nucleus and the relative biologic effectiveness divided by the macroscopic equilibrium dose of the boron reaction in the tissue of interest. The computed compound factor for $Na_2B_{12}H_{11}SH$ (BSH) in normal brain was 0.37. This factor agreed very well with the value of 0.32 obtained for the brain necrosis with the dog irradiations. The compound factor for the dog's skin was experimentally derived from the dog experiments and was equal to 0.5.

10969 (EGG–2744, pp. 67-75) **Nuclear characterization of the HFR Petten BNCT facility.** Watkins, P. (Institute for Advanced Materials, Petten (Netherlands)); Constantine, G.; Moss, R.L.; Harker, Y.; Amaro, C.; Voorbraak, W.; Stecher-Rasmussen, F.; Verhagen, H.; Perks, C.; Delafield, H. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The major work at Petten over the last few years has been the design and construction of an epithermal neutron beam facility in the HB11 beam tube. Following installation of the filter assembly in 1990, and the first operation of the beam at full reactor power in June 1991, it was finally possible to start the planned series of irradiation experiments. These include phantom irradiations, cell culture experiments and a healthy tissue tolerance study using beagle dogs. Prior to this work a considerable amount of neutron and photon dosimetry was performed to measure various parameters of the beam. Apart from providing definite values for such data, these measurements were essential to validate the calculational models which were used in the design and later for the treatment planning. The campaign of measurements at HB11 has continued in parallel with the other experiments noted above. In this paper, the various measurements that have been performed are reviewed both for the free beam and also within phantoms. These were undertaken as part of an intensive collaborative effort between NEL, AEA Harwell, ECN and JRC Petten and included: stacked resonance-energy activation foils for measuring the neutron spectrum in the thermal energy range; threshold foils and proton recoil proportional counters for the fast neutron energies; and thermoluminescence detectors (TLD) for the gamma field.

10970 (EGG–2744, pp. 83-88) **Analytical dosimetry and treatment planning for BNCT.** Nigg, D.W. (Idaho National Engineering Lab., Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Calculation of radiation dose distributions for Boron Neutron Capture Therapy (BNCT) is an essential supporting function for in vivo BNCT radiobiological research. Such calculations will also ultimately be routinely required for human treatment planning. Radiation transport and dose distribution analysis for BNCT is much more complex than is the case for standard photon therapy. There are several different physical radiation dose components associated with BNCT, each of which has its own characteristic spatial distribution and Relative Biological Effectiveness (RBE). Most of these radiation dose components result from neutron interactions that take place after the incident neutrons from the treatment beam have undergone several scattering interactions. Accordingly, many of the simplifying assumptions that work well for radiation transport calculations associated with treatment planning for standard photon therapy are not appropriate for BNCT. Full three-dimensional calculations with an explicit treatment of particle scattering and tissue heterogeneities are required.

10971 (EGG–2744, pp. 89-95) **Post treatmeat dose distribution evaluation for a recent NCT patient.** Storr, G.J. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Wheeler, F.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

As a prelude to establishing, (1) criteria for selection of Boron Neutron Capture Therapy (BNCT) epithermal beam clinical trial patients and (2) treatment planning strategies, post-treatment evaluations of dose distributions in several BNCT patients are being done using the Idaho National Engineering Laboratory (INEL) BNCT Program's patient treatment planning software (bnct-edit and rtt-MC). The objectives of this work are: (1) calculate the dose delivered to the BNCT treated patients; (2) calculate the possible dose distribution for the patients using the proposed Georgia Institute of Technology's reactor epithermal beam; (3) correlate calculated dose with effect.

10972 (EGG–2744, pp. 97-102) **Enantioselective synthesis of an unnatural amino acid, L-carboranylalanine.** Radel, P.A. (Univ. of California, San Francisco, CA (United States)); Kahl, S.B. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have synthesized L-carboranylalanine enantioselectively and in good yields. The route lends itself to eventual gram scale synthesis. D-carboranylalanine has also been synthesized, in similar yields and diastereoselectivities. The introduction of the α-amino group is accomplished via highly diastereoselective bromination (98:2) of an imide system with subsequent azide displacement to yield and azidoimide, which can be converted without significant erosion of stereointegrity to the desired amino acid. L-carboranylalanine may find an immediate application as a selective tumor localizing drug for melanoma in BNCT. Both L- and D-carboranylalanine will be utilized by incorporation into peptide analogs targeted for receptor mediated processes, to develop new tissue specific localizing drugs for various cancers in BNCT treatment. L- and D-carboranylalanine will also prove to be useful structure/activity probes in general peptide design/function elucidation work.

10973 (EGG–2744, pp. 103-108) **Carbonyl nonahydrodecaborate(1-): A versatile synthon for functionalized borane anions.** Shelly, K. (Univ. of California, Los Angeles, CA (United States)); Hawthorne, M.F.; Knobler, C.B. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Despite the surging interest in neutron capture therapy, the development and testing of new boron containing compounds has not received as much attention as other areas of BNCT. The most intensively studied boron agents are the mercaptoundecahydro-closo-dodecaborate dianion ($[B_{12}H_{11}SH]^{2-}$, "BSH") and 4-(dihydroxyboryl)phenylalanine (BPA), yet both of these species have been known for decades. The development of new boron agents for BNCT requires convenient high-yield methods for the introduction of boron moieties into suitable chemical structures. Common strategies employed in the synthesis of new materials for BNCT include the attachment of boron-containing residues to existing compounds known to accumulate in tumor tissues or polymeric carrier delivery agents. The most popular large boron-rich moiety used to accomplish this is the carboranyl group derived from ortho-carborane, $C_2B_{10}H_{12}$. This molecular offers the advantages of relative stability, high boron content, and the versatility of its derivative chemistry. The use of the carboranyl moiety may be limited, however, due to its extreme hydrophobicity, although in many cases it may be transformed to the more hydrophillic $-C_2B_9H_{10}^-$group. The author's interest is in the production of a variety of water-soluble boron species for encapsulation in liposomes prompted the reexamination of the carbonylation of polyhedral borane anions. This led to the development of a convenient method to produce monofunctionalized derivatives of $[B_{10}H_{10}]^{2-}$ in high yield.

10974 (EGG–2744, pp. 109-116) **Boron delivery to tumors mediated by macromolecules and vesicles.** Hawthorne, M.F. (Univ. of California, Los Angeles, CA (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

During the past decade many types of macromolecular species potentially capable of selectivity transporting large quantities of ^{10}B to tumor have been examined for the purposes of BNCT. These large boron carriers have either been obtained by the conjugation of high-molecular weight biomolecules, such as antibodies, with small boron-containing reagents or the purposeful synthesis of large boron-rich oligomers which are then attached as reagents to antibodies or other peptides targeted for tumor cell receptor sites. In addition to the use of large molecules as boron carriers, recent research has demonstrated the utility of synthetic unilamellar liposomes as tumor cell-selective vesicles capable of the in vivo delivery of therapeutic quantities of boron to tumor with low injected doses of boron. A group of receptor-mediated vesicular delivery systems are under preliminary examination which are comprised of low density lipoproteins filled with hydrophobic carborane derivatives. The characteristic common to all of these macromolecular and vesicular tumor targeting boron delivery systems is their use of receptor sites that are either unique to tumor cells or grossly overexpressed by tumor cells relative to the cells which comprise normal tissues.

10975 (EGG–2744, pp. 117-122) **Liposomal delivery of boron to murine tumors for boron neutron capture therapy.** Feakes, D.A. (Univ. of California, Los Angeles, CA (United States)); Shelly, K.J.; Hawthorne, M.P.; Schmidt, P.G.; Elstad, C.A.; Meadows, G.G.; Bauer, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Liposomes, of a specific size and composition, have demonstrated unique ability to selectivity deliver significant quantities of boron to murine tumors. Aqueous solutions of water soluble compounds with a high boron content have been encapsulated into the liposomes and studied in vivo. Although the liposomes deliver their contents to the interior of the tumor cells, the characteristics of the boron compound determine whether boron will be retained by the tumor cells or simply cleared from the system. Investigation of a series of compounds which vary in characteristics such as size, charge, and reactivity have allowed us to develop a working hypothesis which predicts a priori, with some degree of success, the ability of these boron compounds to be retained by tumor cells.

10976 (EGG–2744, pp. 123-128) **Low density lipoprotein reconstitutions with alkyl and aryl carboranes.** Kahl, S.B. (Univ. of California, San Francisco, CA (United States)); Pate, D.W.; Wainschel, L.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Low density lipoproteins (LDL's) are among the most attractive of possible boron delivery methodologies by virtue of their high carrying capacity for hydrophobic boron compounds and their cellular internalization through receptor-mediated processes. Previous work in this laboratory has demonstrated that long chain unsaturated fatty alcohol esters of carborane carboxylic acid can be very efficiently exchanged for the cholesterol ester core of human LDL. In collaboration with coworkers at Brookhaven National Laboratory using in vitro techniques, the authors have found that: (a) boron concentrations exceeding 10 times that needed for therapy were easily obtained; (b) boron remained firmly bound despite repeated washings and suspension in boron-free medium; (c) boron distribution was intracellular, with a biological efficacy indicative of a cytoplasmic location; (d) in vitro uptake and efficacy studies were consistent with a receptor-mediated binding mechanism; (e) boron uptake, retention, and efficacy were better by far than those obtained with any other boron compound previously studied. The present study was undertaken to determine whether simple alkyl and aryl carboranes could be similarly exchanged for LDL cholesterol and, if so, whether any identifiable structure-activity relationships among the compounds could be identified. The authors also wished to determine whether reconstituted LDL's suffered serious aggregation and to demonstrate that ICP-AES and prompt gamma spectrometric boron assay procedures produced coincident numbers.

10977 (EGG–2744, pp. 151-157) **NMR studies of the interaction of borocaptate sodium with serum albumin.** Tang, Peng-Peng Z. (Univ. of Utah, Salt Lake City, UT (United States)); Schweizer, M.P.; Bauer, W.F.; Bradshaw, K.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The interaction between BSH and serum albumin is of interest because it is related to the pharmacokinetics of BSH. Early research suggested that covalent disulfide bridges might be involved in the interaction, but the idea was contradicted by subsequent studies, using ^{11}B Nuclear Magnetic Resonance (NMR) spectroscopy. NMR has been proved to be a very powerful technique to study the protein binding of a small molecule, such as BSH, and boron NMR activity, but ^{11}B has better NMR sensitivity (16.5% vs. 2% relative to ^1H) and a larger natural abundance (81% vs. 19%). Even though ^{10}B is the neutron active nucleus for BNCT, the more sensitive nucleus ^{11}B is more appropriate for NMR studies. Since the isotopic difference does not make any differences in the structure and binding effect of a compound, the result obtained from the ^{11}B NMR of BSH can hold for the ^{10}B enriched agent.

10978 (EGG–2744, pp. 168-176) **Large animal studies of the use of BNCT for the treatment of brain tumors.** Gavin, P.R. (Washington State Univ., Pullman, WA (United States)); DeHaan, C.E.; Moore, M.P.; Weidner, J.P.; Swartz, C.D.; Kraft, S.L.; Atkinson, C.A.; Amaro, C.R.; Bauer, W.F.; Siefert, A. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Animal models are useful to study the relative effects of BNCT on normal tissues and tumors. True efficacy studies of the modality

on glioblastoma or other human malignancies requires human clinical trials. The use of large animals, primarily dogs, to study the effects of BNCT has been and continues to be of major interest. The use of large animals permits the study of normal tissue tolerance of the tissues of the head at an acceptable total body dose. These studies have been extended from normal dogs to dogs with induced and spontaneous tumors. While induced tumors in rodents are often used to study tumor response, the total body dose accompanying BNCT severely limits their use for normal tissue tolerance studies, especially with the epithermal-neutron beams.

10979 (EGG–2744, pp. 209-216) **Computer modeling the boron compound factor in normal brain tissue.** Gavin, P.R. (Washington State Univ., Pullman, WA (United States)); Huiskamp, R.; Wheeler, F.J.; Griebenow, M.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The macroscopic distribution of borocaptate sodium ($Na_2B_{12}H_{11}SH$ or BSH) in normal tissues has been determined and can be accurately predicted from the blood concentration. The compound para-borono-phenylalanine (p-BPA) has also been studied in dogs and normal tissue distribution has been determined. The total physical dose required to reach a biological isoeffect appears to increase directly as the proportion of boron capture dose increases. This effect, together with knowledge of the macrodistribution, led to estimates of the influence of the microdistribution of the BSH compound. This paper reports a computer model that was used to predict the compound factor for BSH and p-BPA and, hence, the equivalent radiation in normal tissues. The compound factor would need to be calculated for other compounds with different distributions. This information is needed to design appropriate normal tissue tolerance studies for different organ systems and/or different boron compounds.

10980 (EGG–2744, pp. 217-224) **Computer modeling the boron compound factor in brain tumors.** Gavin, P.R. (Washington State Univ., Pullman, WA (United States)); Huiskamp, R.; Griebenow, M.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Dogs with spontaneous brain tumors have been used to study the potential of boron neutron capture therapy (BNCT) using an epithermal neutron beam with borocaptate sodium ($Na_2B_{12}H_{11}SH$ or BSH). The compound para-borono-phenylalanine (p-BPA) has also been studied in dogs with oral melanomas and normal tissue distribution has been determined It has been suggested that the term "compound factor" be used to describe the product of the microscopic distribution and relative biologic effectiveness (RBE) of the $^{10}B(n, \alpha)$ reaction to predict the normal and tumor tissue responses. This paper reports the computer model that was used to predict the compound factor for BSH and p-BPA and, hence, the equivalent radiation in tumors and the relation to normal tissue response. The compound factor would need to be calculated for other compounds with different distributions.

10981 (EGG–2744, pp. 231-238) **Dose optimization for boron neutron capture therapy of spontaneous canine brain tumors.** Atkinson, C.A. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Wheeler, F.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The ultimate success of Boron Neutron Capture Therapy (BNCT) will depend, among other things, upon the ability to calculate, a priori, accurate and optimal radiation dose distributions in the target volume. Twenty-one dogs with spontaneously-occurring brain tumors have been treated, at the Brookhaven Medical Research Reactor (BMRR) in a collaborative effort between the Idaho National Engineering Laboratory (INEL), Washington State University (WSU), and Brookhaven National Laboratory (BNL). Because these 21 treatments were designed to demonstrate safety rather than efficacy, the dogs involved did not necessarily received irradiations corresponding to a treatment plan designed to maximize the estimated cell kill at the target location. Four of these dogs (with intra-axial tumors above the tentorium) were chosen as test cases to determine the effects of optimizing treatment. Although the tumors present in all four dogs were of the same type, they varied significantly in size and location. Optimum treatment was found by varying boron concentration and incident neutron beam position and size. The effect of using a beam having a "cleaner", more forward-peaked angular distribution [Georgia Tech Research Reactor (GTRR)] was also examined.

10982 (EGG–2744, pp. 245-252) **The use of boron neutron capture for the treatment of pituitary tumors.** Albertson, B.D. (Oregon Health Sciences Univ., Portland, OR (United States)); Millan, M.A.; Willeke, G.B.; Loriaux, D.L.; Binney, S.E.; Martsolf, S.W.; Johnson, J.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Pituitary tumors comprise approximately 15% of all intracranial tumors. The clinical presentation of these tumors is diverse; morbidity and mortality can be high. Current treatment modalities include conventional X-irradiation and/or neurosurgery, but are inadequate for the most part. Neither are uniformly successful and both are relatively non-specific. However, several features of these tumors make them ideal candidates for Boron Neutron Capture Therapy (BNCT). First, the tumors are localized in the pituitary gland, rarely metastacising to other areas of the body. Second, they are rarely larger than 2 cm in diameter. Third, the tumors are outside the blood brain barrier. And fourth, the pituitary tumor cells contains cellular membrane receptors that bind and internalize specific hypothalamic polypeptide releasing hormones. The ability to target boron-10 (^{10}B) containing compounds to these pituitary tumor cells with releasing hormones and subsequently kill these cells with BNCT is currently being evaluated in pituitary tumor cells in vitro.

10984 (INIS-mf–14445, pp. 1-17, PAPER C-3) **The trial detection of malaria sporozoit in field-collected mosquito by immunoradiometric assay in Thailand.** Kasemsuth, R. (Mahidol Univ., Faculty of Tropical Medicine (Thailand)); Asavanich, A.; Sucharit, S.; Vutikes, S.; Vutikes, M.; Patamatum, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The sporozoite rate, species of parasite and vector are important in the epidemiology of malaria. The investigation of sporozoite by dissection and examination under a microscope is time-consuming and it could be done only on freshly killed mosquitoes. Immunoradiometric assay (IRMA) that can detect, identify and quantify malaria sporozoite (Zavala et al., 1982) was therefore applied to detect sporozoite in laboratory-maintained Anopheles dirus and wild-caught mosquitoes. Study on P. falciparum-infected An. dirus showed that the circumsporozoite (CS) antigen was first found in the abdomen on the 10th day post-infection, whilst the sporozoites were examined in salivary glands from day 15 onwards. The malaria infection in wild-caught mosquitoes were investigated in Anopheles spp collected by human baites from three endemic areas in Thailand. Since the sporozoite rate refers to the presence of sporozoite in the salivary gland, then only head-thorax part of the

specimens were detected by IRMA to prevent an exaggeration over the true results. It was found that none of mosquitoes collected from Phrae was positive for malaria. Four out of 1243 An. dirus among eight species collected from Chantaburi were positive for P. falciparum with sporozoites ranged from 270 to 3875. Of all ten species collected from Kanchanaburi, two and one out of 3123 An. minimus were positive for P. falciparum and P. vivax with sporozoites found in head-thorax portions were 1880, 2380 and 1026 respectively. It is evident that the IRMA is suitable for the investigation of malaria sporozoites in this region. The application of this technique in the further epidemiological study is in progress.

10985 (INIS-mf–14445, pp. C-2, 13) **Coordinated research programme on the quantitative evaluation of nuclear imaging procedures for the diagnosis of liver diseases.** Na-Songkla, S. (Siriraj Hospital Medical School, Bangkok (Thailand). Section of Nuclear Medicine). Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The project was coordinated research programme among RCA countries under supervision of The International Atomic Energy Agency. Quantitative evaluation of nuclear imaging procedures were performed to find out the current status of nuclear medicine in the country and clinical efficacy of instruments and nuclear medicine physician in techniques of making diagnosis of liver disease. Sensitivity and specificity of each institute were quantitated and compared each other in the country and among RCA countries.

10986 (INIS-mf–14466) **Modification of the labelling autologous erythrocytes with Tc-99m to scintigraphic evaluation of deep vein system.** Ciencia y Tecnologia Nuclear, v. 11-2. Quintero, C.M. (Seccion Medicina Nuclear, Direccion General de Energia Nuclear (Guatemala)); Freire, D.Y. Direccion General de Energia Nuclear, Guatemala City (Guatemala). 1993. 5p. (In Spanish). Order Number DE95618538. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this was the modification of labelled autologous red blood cells in vivo/in vitro. Evaluation consisted in different combinations of Tc-99m radiopharmaceuticals as pyrophosphate (PYP) and stannous chloride (SnCl2), anticoagulants as heparin and acid-citrate-dextrose (ACD), and oxidant agents as hydrogen peroxide (H2O2) and sodium hypochlorite (NaClO); factorial block design was carried out to determinate which one brings a better yield of labelling, and more advantages of availability. Results showed that all tested combinations were above 90% labelled; variance analysis indicated significant difference between the two radiopharmaceuticals ($P<0.05$), being higher percent of labelling with PYP than SnCl2, and PYP-ACD-NaClO the best combination. It was demonstrated that the procedure is safe because hemocultives realized during the labelling process were all negative, evidencing no bacterial contamination. There were significant erythrocyte-shape modifications, too. Due to low costs and good availability of H2O2 as oxidant agent there were no statistic significant differences between the use of H2O2 or NaClO, the modification PYP-ACD-H2O2 will be used as scintigraphic test for deep vein thrombosis.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

During 1990, 467 medical radiology mis administration cases, involving 573 patients, were reported to the Nuclear Regulatory Commission in the USA. Of the 467, 443 cases were related to diagnostic radiology and 24 to radiation therapy. Details on these events were reported by the NRC's Office for Analysis and Evaluation of Operational Data (AEOD). This office serves also as the NRC's center for the independent assessment of operational events. The above data were taken from the medical mis administration report of the AEOD office. Several cases from this report were mentioned also in the NRC's 1991 Annual Report. (authors).

Diagnostic and therapeutic radiology both play have a role in health care of the population in a modern society. Diagnostic radiology consists of x-ray examinations (radiography, CT mammography, etc.) and nuclear medicine examinations (function testing, scanning, etc.). Therapeutic radiology involves the treatment of malignant and benign tumors by means of teletherapy (linear accelerators, ^{60}Co irradiators, etc.), brachytherapy (intracavitary or interstitial) and the administration of unsealed radionuclides (^{131}I, ^{32}P and others) into the human body. These medical applications are the main source of exposure of the general population to ionizing radiation that arises from artificial sources. (authors). 12 refs.

Radiosurgery is currently employed for the management of a variety of neurosurgical pathologies, including cerebral arteriovenous malformations, small benign intracranial tumors such as meningioma and acoustic schwannoma, and selected malignant tumors such as metastases. Radiosurgery represents an effective treatment alternative whenever direct surgical intervention is felt to be contraindicated . Complications of radiosurgery are reportedly infrequent and typically related to radiation injury of brain tissue or cranial nerves surrounding the target. For the most part, these side effects take place months to years after treatment. Acute side effects of radiosurgery include seizures, vomiting and headaches. Alopecia is a frequent complication of fractionated radiation to the skull, but has only once been reported with radiosurgery. We experienced this complication in one of 35 patients in our series. (authors). 6 refs.

During cardiac systole, the cardiac stroke volume increases tile blood volume in tile lungs. The pulmonary systolic blood volume increase is lower than the stroke volume since some blood flows from the lungs into the left atrium during the systolic period. The relative pulmonary systolic blood volume increase, which is the ratio of pulmonary, systolic blood volume increase to the stroke volume, was measured in patients using ECG gated radionuclide image analysis. (authors). 1 ref., 3 figs.

10991 (Juel–2910) **Parallel algorithms and tools for matching functional and anatomical data on the basis of PET and MRT volume data.** Esseling, N. Forschungszentrum Juelich GmbH (Germany). Zentralinstitut fuer Angewandte Mathematik. May 1994. 133p. (In German). Order Number DE95746503. Source: OSTI; NTIS (US Sales Only); INIS.

In this report an algorithm to match positron-emission-tomography (PET) scans with nuclear-magnetic-resonance (NMR) scans in three dimensions is presented and evaluated. The algorithm used here is refered as head-and-hat-method in literature. The matching is computed using detectable surfaces in each data set. With this information, a coordinate transform is computed in order to assign PET data and high resolution MRT data. The visualization system AVS is utilized to give the user an easy-to-use interface and is also employed as development environment. As a very high computation demand is expected with this algorithm, the second part of this report describes a parallel implementation of the head-and-hat-method, which was implemented on the massively-parallel computer system Intel Paragon. A client/server model was developed to maintain the same user environment for the sequential and the parallel version of this algorithm. This model combines the advantage of parallel computing with the advantages of visualisation and user interface provided by AVS. (orig.)

10992 (LA-UR–94-4378) **Neuromagnetic source reconstruction.** Lewis, P.S. (Los Alamos National Lab., NM (United States)); Mosher, J.C.; Leahy, R.M. Los Alamos National Lab., NM (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. NIMH Grant R01-MH-53213. (CONF-9505158–1: IEEE conference on acoustics, speech and signal processing, Detroit, MI (United States), 8-12 May 1995). Order Number DE95005242. Source: OSTI; NTIS; GPO Dep.

In neuromagnetic source reconstruction, a functional map of neural activity is constructed from noninvasive magnetoencephalographic (MEG) measurements. The overall reconstruction problem is under-determined, so some form of source modeling must be applied. We review the two main classes of reconstruction techniques-parametric current dipole models and nonparametric distributed source reconstructions. Current dipole reconstructions use a physically plausible source model, but are limited to cases in which the neural currents are expected to be highly sparse and localized. Distributed source reconstructions can be applied to a wider variety of cases, but must incorporate an implicit source, model in order to arrive at a single reconstruction. We examine distributed source reconstruction in a Bayesian framework to highlight the implicit nonphysical Gaussian assumptions of minimum norm based reconstruction algorithms. We conclude with a brief discussion of alternative non-Gaussian approachs.

10993 (LA-UR–94-4387) **Matrix kernels for MEG and EEG source localization and imaging.** Mosher, J.C. (Los Alamos National Lab., NM (United States)); Lewis, P.S.; Leahy, R.M. Los Alamos National Lab., NM (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. NIMH Grant R01-MH53213. (CONF-9505158–2: IEEE conference on acoustics, speech and signal processing, Detroit, MI (United States), 8-12 May 1995). Order Number DE95005238. Source: OSTI; NTIS; INIS; GPO Dep.

The most widely used model for electroencephalography (EEG) and magnetoencephalography (MEG) assumes a quasi-static approximation of Maxwell's equations and a piecewise homogeneous conductor model. Both models contain an incremental field element that linearly relates an incremental source element (current dipole) to the field or voltage at a distant point. The explicit form of the field element is dependent on the head modeling assumptions and sensor configuration. Proper characterization of this incremental element is crucial to the inverse problem. The field element can be partitioned into the product of a vector dependent on sensor characteristics and a matrix kernel dependent only on head modeling assumptions. We present here the matrix kernels for the general boundary element model (BEM) and for MEG spherical models. We show how these kernels are easily interchanged in a linear algebraic framework that includes sensor specifics such as orientation and gradiometer configuration. We then describe how this kernel is easily applied to "gain" or "transfer" matrices used in multiple dipole and source imaging models.

10994 (LA-UR–95-371) **Analysis of Lymphangioleiomyomatosis (LAM) patent tomograms: Stereology and modeling.** Faber, V. (Los Alamos National Lab., NM (United States). Computing, Information, and Communications Div.); Wing, G.M.; Winter, L.; Zahrt, J.D. Los Alamos National Lab., NM (United States). [1995]. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006271. Source: OSTI; NTIS; INIS; GPO Dep.

Lymphangioleiomyomatosis (LAM) is an insidious disease of young women which attacks the lungs and if untreated results in death. Treatment is radical. Currently a woman diagnosed as having LAM (usually by computed tomography (CT) of the lung) is run through an exhausting set of tests and exercises to determine the extent of the disease. Image processing techniques have been able to quantify the tomograms by providing a histogram of the number of cyst intercepts of a given area. The images are digital, so the data are discrete, and the areas are in terms of square pixels. It is hoped that by analyzing the data and by recovering the probability density of the cysts themselves one can provide a set of parameters that will aid in the early diagnosis of the disease and that will correlate well with the physiology. The desire to invert the data, that is to determine the probability density of the cysts from the probability density of the circular intersections of the cysts with the tomographic plane, led to a re-examination of the Wicksell equation. In Section 2, the authors transform Wicksell's equation in diameter (a generalized Abel equation) into an equation in areas (the original Abel equation). In Section 3 they present the adjoint equation in several equivalent forms. Analytic solutions of the adjoint equation necessary for later use are developed in Section 4. Outside of the framework of integral equations they have done some modeling of the data. They find that, to a very high degree of reliability, the data follows a simple power law. The distribution of spheres likewise follows a simple power law. These considerations are given in Section 5. Then in Section 6 they explore the exponential model as an alternative. Section 7 solves the Wicksell equation and uses the Golberg device, via the adjoint, to solve a related problem. They finally get to the number of cysts and their average size in Section 8. Their conclusions are in Section 9.

10995 (NEI-DK–1761) **Continuous and split-course radiotherapy in locally advanced carcinoma of the uterine cervix. Analyses of local control, distant metastases, crude survival, early and late morbidity and prognostic factors.** Pedersen, D.E. Kraeftens Bekaempelse, Aarhus (Denmark). Afd. for Eksperimentel Klinisk Onkologi; Aarhus Universitetshospital (Denmark). Afd. for Onkologi. 1994. 83p. Order Number DE95621440. Source: OSTI; NTIS; INIS.

From 1974 to 1984, 442 consecutive patients with carcinoma of the uterine cervix were referred for combined intracavitary (IRT) and external radiotherapy (ERT). Dose prescriptions were performed based on the points A and B of the Manchester system. From 1978 the treatment strategy was changed from continuous (CRT) to split course radiotherapy (SCRT) with a higher total dose to point B, a lower dose to point A from the IRT, and a longer total treatment time (TTT). The purpose of the present thesis is: To evaluate local tumour control, distant metastases, survival and

complications in the rectosigmoid and bladder in relation to treatment strategy (continuous and split course radiotherapy). To evaluate prognostic factors and importance of treatment strategy for local control, distant metastases, and survival by uni- and multivariate analyses. To develop a classification system (AADK, Aarhus, Denmark) for the recording of early and late radiation complications allowing and estimation of the importance of latency when reporting late radiotherapeutic morbidity and a rescoring of complication grade, and to compare results from AADK with those from the French-Italian glossary recording the maximal damage. To evaluate early and late radiotherapeutic morbidity and the importance of latency by comparing frequencies and actuarial estimates of late complications, to estimate the combined late organ morbidity and the probability of being alive, cured and without serious complications. (EG) (61 refs.).

10996 (NIRS-M–99, pp. 14-15) **Effects of object size on a function to convert X-ray CT numbers into the water equivalent path length of charged particle beam.** Minohara, Shinichi (National Inst. of Radiological Sciences, Chiba (Japan)); Kanai, Tatsuaki; Endo, Masahiro; Kawachi, Kiyomitsu. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

The purpose of this study is to estimate the accuracy of X-ray CT method for determining the water equivalent path length of charged particle beams. For the planning of charged particle beam treatment, a function to convert the CT number of X-ray CT images into water equivalent path length is required. This function is used for calculating dose distribution and designing patient compensator. However, the CT number for a material varies according to the method of imaging process of CT scanners, object size, and the degree of inhomogeneity. The converting function is experimentally determined by measuring various materials. In this report, the effects of object size on the converting function are described. The samples that were measured for determining the converting function are shown. The water equivalent length of proton beam and carbon beam were measured with water columns. X-ray CT data were taken with a Shimadzu CTS-10 in two cylindrical phantoms of different sizes. The results are reported. The difference in water equivalent path length between proton beam and carbon beam was less than 1%. The CT number at various parts did not change. (K.I.).

10997 (ORNL/TM–12817, pp. 253-257) **Photostimulated luminescence of KBr-In induced by excitation with UV radiation.** Plavina, I. (Institute of Physics, Salaspils (Latvia)); Popov, A.I. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years photostimulated luminescence (PSL) has drawn the attention of many scientists because of applications for X-radiation imaging. For this purpose, a variety of different PSL phosphors have been considered. In our recent endeavor to use alkali halide crystals as photostimulated storage materials, we have carried out detailed investigations of PSL with alkali halides doped with ns^2 - ions. It has been found that the KBr-In crystal possesses a prominent PSL ideal for He-Ne laser stimulation. The main goal of this paper is to present new results and the analyze what was earlier found in the PSL studies in KBr-In crystals that were UV-irradiated in the fundamental excitation absorption band.

10998 (ORNL/TM–12817, pp. 259-268) **Powdered KBr-In as an effective x-ray storage material with a wide dynamic range.** Kalninsh, A. (Institute of Physics, Salaspils (Latvia)); Plavina, I.; Tale, A.; Popov, A.I. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In the last decade a new technique for X-ray imaging based on the photostimulated luminescence (PSL) has gained considerable importance, especially in medical diagnostics and crystallography. This technique is based on the use of a photostimulable storage phosphor screen. The purpose of this paper is to report the relation between the dose of energy stored and the PSL response for a new photostimulable material, KBr-In, when the kind of energy used is X-radiation over the range suitable for diagnostic medicine. Recently we have demonstrated that KBr-In is an effective UV radiation storage material with a wide dynamic range over seven orders of magnitude.

10999 (PNL-SA–25677) **Transmission of olfactory information for tele-medicine.** Keller, P.E.; Kouzes, R.T.; Kangas, L.J.; Hashem, S. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950162–1: Medicine meets virtual reality, San Diego, CA (United States), 19-22 Jan 1995). Order Number DE95007269. Source: OSTI; NTIS; GPO Dep.

While the inclusion of visual, aural, and tactile senses into virtual reality systems is widespread, the sense of smell has been largely ignored. We have developed a chemical vapor sensing system for the automated identification of chemical vapors (smells). Our prototype chemical vapor sensing system is composed of an array of tin-oxide vapor sensors coupled to an artificial neural net-work. The artificial neural network is used in the recognition of different smells and is constructed as a standard multilayer feed-forward network trained with the backpropagation algorithm. When a chemical sensor array is combined with an automated pattern identifier, it is often referred to as an electronic or artificial nose. Applications of electronic noses include monitoring food and beverage odors, automated flavor control, analyzing fuel mixtures, and quantifying individual components in gas mixtures. Our prototype electronic nose has been used to identify odors from common household chemicals. An electronic nose will potentially be a key component in an olfactory input to a telepresent virtual reality system. The identified odor would be electronically transmitted from the electronic nose at one site to an odor generation system at another site. This combination would function as a mechanism for transmitting olfactory information for telepresence. This would have direct applicability in the area of telemedicine since the sense of smell is an important sense to the physician and surgeon. In this paper, our chemical sensing system (electronic nose) is presented along with a proposed method for regenerating the transmitted olfactory information.

11000 (SAND–95-0109) **A human factors engineering approach to biomedical decision making: A new role for automatic target recognizer technologies.** Sobel, A.L.; Stalker, K.T.; Yee, A. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007317. Source: OSTI; NTIS; GPO Dep.

This report identifies the key features noted as requirements in the diagnostic decision-making process of Single Photon Emission Computed Tomography (SPECT) cardiac imaging. The report discusses the critical issues that create the basic system framework for design of an automatic target recognizer (ATR) algorithm prototype to support diagnosis of coronary artery disease. Candidate feature discovery algorithms that may form the basis of future work include Adaptive Resonance Theory and Bayesian Decision Network. A framework for the practitioner-Human-System-Interface would include baseline patient history and demographic data; reference cardiac imagery history; and current overlay imagery to provide complementary information (i.e., coronary angiography, echocardiography, and SPECT images). The goal is to design a prototype that would represent a fused present and historical "whole" functional, structural, and physiologic cardiac patient model. This framework decision-assisting platform would be available to practitioner and student alike, with no "real-world" consequences.

11001 (SAND–95-0170C) **Surface-emitting superconductor laser spectroscopy for characterizing normal and sickled red blood cells.** Gourley, P.L. (Sandia National Labs., Albuquerque, NM (United States)); Meissner, K.E.; Brennan, T.M.; Hammons,

B.E.; Gourley, M.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–6: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006809. Source: OSTI; NTIS; GPO Dep.

We have developed a new intracavity laser technique that uses a living or a fixed cell as an integral component of the laser. The cells are placed on an AlGaAs/GaAs surface-emitting semiconductor wafer and covered with a glass dielectric mirror to form a laser resonator. In this arrangement, the cells serve as optical waveguides (or lens elements) to confine (or focus) light generated in the resonator by the semiconductor. Because of the high transparency, the cells aid the lasing process to generate laser light. This ultra sensitive laser provides a novel imaging/spectroscopic technique for histologic examination which we demonstrate with normal and sickled human red blood cells. Extremely high contrast microscopic images of the cells are observed near 830-850 nm. These images correspond to electromagnetic modes of cell structures and are sensitive to shape of the cell. Using a high resolution spectrometer, we resolve the light emitted from these images into very narrow spectral peaks associated with the lasing modes. Analysis of the spectra reveals that the distribution of peaks is quite different for normal and sickled red blood cells. This technique, in a more developed form, may be useful for the rapid analysis of other kinds of normal and abnormal cells.

11003 (IAEA-TECDOC–772) **The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. Proceedings of a research co-ordination meeting of the FAO/IAEA/SIDA/OAU/IBAR/PARC co-ordinated research programme.** Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. 239p. (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). Order Number DE95618235. Source: OSTI; NTIS (US Sales Only); INIS.

1993 has been a significant year for PARC with the initiation of the Global Rinderpest Eradication Programme (GREP) providing a new emphasis in the drive towards the final elimination of rinderpest and its causative virus. For PARC this has culminated in a declaration by Egypt that it will cease vaccination at the beginning of 1994 and a strong commitment by a number of West African countries that they too will cease vaccination during 1994 and make the OIE Declarations of Provisional Freedom from Rinderpest. These significant steps forward in the eradication process would not have been possible without the information and confidence provided by the PARC sero-monitoring network. But even more important has been the clear demonstration that is possible to maintain the routine operation of an epidemiological network providing reliable results for a number of years in over 20 African countries. Such a system is vital if rinderpest is to be eradicated from the region and the bold move of a number of countries to now cease vaccinating is, in part, a testimony to the success of this network. This publication details the 1993 sero-monitoring results on a country to country basis, provides details of the external quality assurance programme and provides a series of conclusions and recommendations on the way to proceed in the future for this surveillance network. Refs, figs and tabs.

An external quality assurance programme has been in operation for the past two years to provide assurance to all those involved in the Pan African Rinderpest Campaign (PARC) that the results being provided by laboratories testing cattle sera as part of the sero-monitoring programme are reliable. In 1993 20 out of the 21 participating laboratories submitted results within two months of receiving the sera and these showed a marked improvement over last year with an overall 97% agreement between laboratories. The Central African Republic did not submit QA results in time for the research co-ordination meeting held in Egypt in November but did submit results by December and these were all correct. In Niger nearly half the sera were tested incorrectly although this was subsequently shown to be due to misplacement of the sera on the ELISA plate. If these results are discarded 99% of the sera were tested correctly indicating the high level of competence that now exists in the network and providing confidence to national veterinary authorities and international organizations of the validity of the sero-monitoring results being obtained. (author). 3 refs, 4 figs, 5 tabs.

Rinderpest control in Egypt has focussed for many years on the annual vaccination of all animals. In 1992 it was decided to vaccinate adult animals only twice and to cease vaccination of animals under the age of one year in an attempt to detect any circulating rinderpest virus. A national serological survey was undertaken to determine the level of immunity of cattle to rinderpest, linked with a serological and clinical survey of cattle and buffaloes under one year of age to determine if rinderpest virus was circulating in this population. At the same time a survey was undertaken of sheep and goats to determine if any serological evidence could be found of rinderpest virus in this group. The results show that levels of immunity in cattle are around 70% and in buffaloes around 50%. No substantive evidence could be found indicating the presence of rinderpest virus in cattle, buffalo, sheep or goats in Egypt. Based on the above it is appropriate that Egypt cease rinderpest vaccination and make the OIE declaration of provisional freedom from rinderpest. (author). 6 refs, 3 figs, 7 tabs.

11007 (IAEA-TECDOC–772, pp. 41-48) **Rinderpest disease and sero-survey in Ethiopia.** Gopilo, A. (Ministry of Agriculture, Addis Ababa (Ethiopia). Shola Zonal Disease Investigation Lab.). Rinderpest is endemic in Ethiopia. In 1992/1993 twenty seven outbreaks were investigated and six of these were confirmed by agar gel diffusion test. Most of the disease outbreaks were associated with lowland nomadic cattle. Areas of rinderpest maintenance have been identified and it was decided to carry out sero-survey activities primarily in one of these areas. This report includes results from the north-western part of the country, where rinderpest is known to occur throughout the year. A total of 7582 sera were collected from 225 herds in 34 districts from five regions during 1992/93. 3491 (46%) were found to be positive for rinderpest antibody. 52% (117/225) of the herds investigated had below 50% and 19% (42/225) had above 75% of herd immunity. The distribution of immunity in animals varied in average from 30% to 63% with age. Analysis of data on relation to the presence of ear marks and immunity displayed that 70% (1966/2811) of ear marked and 32% (1516/4771) of not marked animals were positive for rinderpest antibody. It is not known why a significant number of ear marked animals have been antibody negative. Marking of animals as being vaccinated could be misleading if not carried out properly. It appears that the distribution of herd immunity varied from district to district and with age within herds. Serological monitoring is an excellent management tool for rinderpest control programme if well designed survey is carried out. (author). 5 refs, 5 figs, 4 tabs.

11008 (IAEA-TECDOC–772, pp. 49-68) **Rinderpest sero-surveillance in the Gambia.** Cessay-Bojang, T. (Cental Veterinary Labs., Abuko (Gambia)); Wiltz, D.K.; Touray, E.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). In *The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. Following a cessation of rinderpest vaccination and the provisional declaration of freedom from rinderpest in 1991, Gambia undertook to carry out a detailed serological survey of its cattle population to determine the presence or otherwise of rinderpest virus in order that the OIE could make the official declaration of freedom from disease. Working on an agreed sampling frame 9000 animals have been sampled and tested for rinderpest antibodies using the FAO/IAEA ELISA-based system. Of the animals sampled 2.4% have sero-converted since vaccination ceased. Although no clear explanation is available as to why these animals have sero-converted the number is so small that it is highly unlikely to be due to the circulation of rinderpest virus. Illegal movement of vaccinated animals from Senegal, incorrect ageing of animals and the effect of a BVD virus infection could be possible explanations. Gambia awaits the decision of the OIE with regard to the next phase of the eradication process. Meanwhile, follow up investigations into these aberrant sero-conversions and serological and clinical surveillance for rinderpest will continue. (author). 1 ref., 19 figs, 19 tabs.

Sero-monitoring of the current national vaccination campaign against rinderpest in Ghana has been ongoing for a number of years. An extensive national survey conducted in 1992 indicated that 71% of the national herd was immune, although on an individual herd basis only 35% of herds are protected against rinderpest. A similar survey completed in 1993 indicates that this level of immunity has now risen to 76% with 58% of herds protected. This considerable improvement must be considered in conjunction with the need to achieve 85% immunity in herds to ensure the elimination of both the disease and its causative virus. (author). 3 refs, 13 figs, 13 tabs.

During the year 1992-1993 the sero-monitoring programme at NVRC, Muguga examined 1,718 cattle sera using the competitive ELISA. 1561 samples had been collected in Kenya and the others were submitted from neighboring countries to KARI, Muguga as the regional reference laboratory. 37 sera from sheep, goats or wildlife were also examined as part of the ongoing sero-surveillance activities. The majority of Kenyan sera were collected from two provinces which border endemically infected countries, Eastern Province (Marsabit District) and Rift Valley Province. The prevalence of antibody in 343 sera collected in Marsabit District, where a donor aid programme had funded vaccination, was disappointingly low at 31%. Pre-and post-vaccination herd antibody prevalences at different sampling sites in Rift Valley Province ranged from 30-65% and 68-77% respectively. Only one of 32 primary sampling units was protected for rinderpest with a herd antibody prevalence of greater than 80%. The age distribution of antibodies clearly showed that unprotected animals were largely confined to young stock under three years old whereas more than 85% of the animals older than this age were immune. However there were some individual clusters where even the older animals had low antibody prevalences. After antibodies to rinderpest were detected in the serum form a solitary buffalo in the Nairobi National Park, a serosurvey of 24 more buffaloes in the park failed to show any rinderpest antibody thereby confirming that there had not been widespread infection of this population in the recent past. (author). 2 refs, 4 tabs.

11011 (IAEA-TECDOC–772, pp. 87-94) **Sero-monitoring for rinderpest antibody in cattle in Nigeria, 1993 campaign.** Majiyagbe, K.A. (National Veterinary Research Inst., Vom-Jos, Plateau State (Nigeria). Virology Div.); Shamaki, D.D.; Obi, T.U.; Ezeokoli, C.D. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. Project IAEA-NIR/5/019. In *The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. Proceedings of a research co-ordination meeting of the FAO/IAEA/SIDA/OAU/IBAR/PARC co-ordinated research programme.* 239p. Order Number DE95618235. Source: OSTI; NTIS (US Sales Only); INIS.

The 1993 post vaccination sero-monitoring survey of cattle for rinderpest virus antibodies in Nigeria was carried out by collecting serum samples from three geographical areas. A total of 2,675 samples were collected from 12 states. In the northeast, 823 samples were collected from Borno, Jigawa and Taraba states. In the northwest, 921 samples were collected from Niger, Sokoto and Kebbi states. In the south 931 samples were collected from Anambra, Enugu, Ogun, Oyo, Edo and Ondo states. Sear were analysed using the FAO/IAEA competition-ELISA kit. The overall antibody prevalence in Nigeria for 1993 was found to be 48.2%. In the northeast, the overall prevalence was 60%, whereas the prevalence in the northwest and south was 41% and 44.9% respectively. The prevalence in the various age categories was more or less uniform. The antibody prevalence in 1993 has not shown any improvement over the figures observed for 1991 and 1992. The reason for this is not clear, but there is urgent need to re-appraise the vaccination strategy and programmes in order to find a lasting solution to the perennial low level of immunity in the national herd and the associated risk of the re-emergence of rinderpest. (author). 5 refs, 5 figs, 5 tabs.

11012 (IAEA-TECDOC–772, pp. 95-100) **Seromonitoring of rinderpest in the Sudan, 1993.** Elamin, M.A.G. (Soba Veterinary Research Labs., Soba, Khartoum (Sudan)); Hassan, A.M.; Farah, A.; Babiker, N. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). In *The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. A total of 8000 bovine sera were collected from northern States of the Sudan. The collection was carried out using a random cluster sampling method. The FAO/IAEA competitive ELISA system was used to test the sera for the presence of antibodies to rinderpest virus to determine post-vaccination immunity levels following the PARC rinderpest vaccination programme in Sudan. An overall level of 65% immunity was attained although the results indicated that levels varied throughout the states where sera were collected. (author). 4 refs, 6 figs, 7 tabs.

11013 (IAEA-TECDOC–772, pp. 101-103) **Rinderpest seromonitoring in Tanzania.** Loretu, K. (Animal Disease Research Inst., Dar-es-Salaam (Tanzania)). The national strategy for the control and eradication of rinderpest has concentrated on the establishment of an immune barrier in the north of the country in response to the risk of infection from Sudan and Ethiopia. Sero-monitoring results indicate that in 1993 over 77% of the animals in this barrier zone were immune to rinderpest. Areas where immunity levels were lower were easily identified enabling corrective action to be taken. In areas where no vaccination was being carried out no evidence of circulating virus could be found. This indicates not only the effectiveness of the adopted strategy but the high susceptibility of animals to rinderpest in these areas and the need to maintain intense disease and serological surveillance. (author). 3 refs, 1 fig., 3 tabs.

11014 (IAEA-TECDOC–772, pp. 105-112) **Seromonitoring of rinderpest in Northern Uganda.** Twinamasiko, E.K. Seromonitoring of rinderpest was carried out in the Northern region of Uganda which covers the sub-regions of West Nile, Northern Uganda, and N.E. Uganda. Three thousand nine hundred ninety two serum samples were collected and tested using the competitive ELISA. The antibody prevalence ranged from 21% to 81%. Although the areas at high risk of rinderpest had low antibody levels their neighbors seem to be establishing immune barrier. Since all the sampled districts were equally supported to carry out vaccination, this survey has emphasized the usefulness of sero monitoring in assessing the success of vaccination programmes. (author). 3 refs, 3 figs, 2 tabs.

Epidemiological teams from the Central Veterinary Laboratory and the regional laboratories in Ouahigouya and Tenkodogo collected 8640 sera from 216 sampling sites during the 1992/1993 vaccination campaign. After the analysis of 4320 of these sera, it was found that 68% were immune with some variation in the different age groups. (author). 3 refs, 4 figs, 4 tabs.

Cameroon joined Pan-African Rinderpest Campaign (PARC) in its sero-survey branch in 1989. In 1993, 8517 sera samples collected from 286 cattle herds (from 0 to 3 years old) chosen by randomisation and distributed into three subpopulations (soudano-sahelian, equatorial-guinean, equatorial) of six provinces of the country were tested, using the IAEA/FAO rinderpest ELISA kit: 4566 sera were positive (54% prevalence). Animals from two to three years old presented an immunity level of 69% 45 herds from 286 (15.7%) were protected. The differences of immunity between the three sub-populations and between the six visited provinces are statistically significant. (author). 6 refs, 16 figs, 10 tabs.

11017 (IAEA-TECDOC–772, pp. 137-145) **The seromonitoring of rinderpest in the Central African Republic.** Kondolas, M.G. (Laboratoire Central Veterinaire de Bangui, Bangui

The Central African Republic joined the Pan African Rinderpest Campaign (PARC) in 1989. In 1993, 1305 sera were collected from two regions, Vakaga and Baminigui-Bangor in the north and tested by the ELISA to determine the immunity status of cattle in these areas as part of the FAO/IAEA sero-monitoring programme. An overall immunity level of 60% was found, which is well below the target of 80% considered to be required for protection of the country from rinderpest. The results also highlighted differences in different age groups and districts within the country. (author). 11 figs, 5 tabs.

11018 (IAEA-TECDOC–772, pp. 147-157) **The sero-monitoring or rinderpest in Chad.** Diguimbaye, C. (Laboratoire de Recherches Veterinaires et Zootechniques de Farcha, N'Djamena (Chad)); Kebkiba, B.; Bornarel, P. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (In French). (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). A serosurvey was carried out covering the cattle keeping areas of Chad and 150 herds were selected using the itinerary random sampling method. 5699 sera were collected from October to June. The immunity levels of the cattle population and the number of protected herds have increased since the last sero-survey. The antibody prevalence reached 57.5% ± 7.1%. The over three year old group showed the highest immunity levels reaching only 74.3% ± 8.6% which will still not protect this group. Other parameters examined (Age, earmarking, etc.) showed significant statistical difference. Although the sampling period interfered with two vaccination campaigns there was a considerable improvement compared to previous vaccination campaigns. (author). 7 refs, 2 figs, 27 tabs.

11019 (IAEA-TECDOC–772, pp. 159-161) **The sero-monitoring of rinderpest in Cote d'Ivoire.** Couacy-Hymann, E. (Ministere de l'Agriculture et des Ressources Animales, Bingerville (Cote d'Ivoire). In the Phase I PARC project immunity levels of greater than 88% were obtained in animals older than 2 years. The absence of rinderpest virus in other species of domestic animals has been verified. This present study was concerned with investigating the possibility of any residual virus activity in wild/game animals. All the sera were found to be negative for the presence of antibodies to rinderpest. This result agrees with other studies undertaken in Cameroon and Tanzania and confirm that wild/game animals do not provide a reservoir for residual rinderpest virus. (author).

The fifth post-vaccination sero-survey of cattle was carried out at the Central Veterinary Laboratory, with the objective to estimate the Rinderpest Virus Antibody Prevalance (RVAP) for the Pan-African Rinderpest Campaign (PARC). In this study, 6271 bovine sera were collected in 221 herds using the random sampling method. The cattle population was divided into three sub-populations; Soudan, Sahel and Sahara. The sera were tested using the FAO/IAEA rinderpest competitive ELISA system. The RVAP was 62,20%. The age group of 2-3 year had the best immunity level (73.5%). 105 (47.5%) herds are protected. The observed difference between the sub-populations and the regions is statistically significant. (author). 5 refs, 14 figs, 9 tabs.

11021 (IAEA-TECDOC–772, pp. 177-185) **Evaluation of immune cover against rinderpest and influence of peste des petits ruminants on rinderpest vaccination of Mauritanian cattle.** Guerre, L. (Centre National d'Elevage et de Recherches Veterinaires (CNERV), Nouakchott (Mauritania)); Isselmou, E.; Diallo, B.C. Taking into account the bad results of previous surveys, the Rinderpest serological controls were increased in 1993 and influence of peste des petits ruminants (PPR) infection on Rinderpest vaccination of cattle was studied. The serological investigation of Rinderpest virus antibody prevalence in Mauritania concerned 3368 animals, divided into 90 herds distributed among 6 regions of the south of Mauritania. One thousand seven hundred and six sera collected during this survey were tested against PPR using competitive ELISA test. Five young bovines naturally infected with PPR virus were then vaccinated against rinderpest to evaluate the effect of this infection on vaccination. The results of the Rinderpest sero-survey show a short immune cover rate (45,7%) particularly in animals less than 2 years old. Significant differences in this protection rate exist between regions, sex and managements. Only 7% of herds are protected. The animals are no longer marked when vaccinated and only 55% of marked animals had antibodies against Rinderpest. Since PPR seems to have no great influence in Mauritania on rinderpest virus antibody prevalence reasons for the low immune cover rate of cattle were examined. (author). 10 refs, 4 figs, 4 tabs.

11022 (IAEA-TECDOC–772, pp. 187-194) **Final report of the evaluation of post-vaccination immunity after the 1993 rinderpest vaccination campaign in Niger.** Issoufou, M. Since the last Panafrican Rinderpest Campaign in 1968 Senegal has carried out annual vaccination against rinderpest. The analysis, by competitive ELISA, of 9600 serum samples taken randomly in 20 out of the 30 districts in the country during the first year of sero-surveillance, and the 4200 sera collected in the 10 other districts during the second year, shows that the mean national immunity level is around 68%. None of the 10 regions of the country had immunity levels of 85% or greater - the minimal level needed to ensure eradication of rinderpest. Whilst animals of 3 years and over had reached such immunity levels, other age groups were still well below this and thus not only could the virus survive in this group but there would be many susceptible animals. (author). 5 refs, 5 figs, 4 tabs.

11024 (IAEA-TECDOC–772, pp. 205-211) **Collaborative study on the detection of antibodies against peste des petits ruminants virus in cattle, sheep and goats and the possible implications to rinderpest control programmes.** Anderson, J. Monoclonal antibody-based competitive ELISA (C-ELISA) have been used for the specific measurement of antibodies to both rinderpest and peste des petits ruminants (PPR) viruses in cattle, sheep and goats. Examination of serum samples from sheep and goats in Gambia, before and after vaccination with rinderpest vaccine, suggested that antibodies to PPR virus could prevent an immune response to the rinderpest vaccine. Cattle sera from nigeria and Ghana showed a high prevalence of antibody against PPR virus which may explain the difficulty experienced in some countries in achieving high post-vaccination immunity levels against rinderpest. This is further supported by experiments in Nigeria where a high percentage of cattle sero-positive for PPR failed to respond serologically following rinderpest vaccination. Because antibodies against PPR virus are both cross-neutralizing and cross-protective against rinderpest virus further vaccination in the presence of antibodies against PPR virus may be a waste of national resources. This paper presents serological evidence for the transmission of PPR virus from sheep and goats to cattle and highlights the need to include PPR serology in the sero-monitoring programme to give a better indication of national herd immunity in PPR endemic areas where problems of reaching high immunity without obvious cause are being encountered. (author). 7 refs, 5 tabs.

11025 (IAEA-TECDOC–772, pp. 213-218) **Diagnosis of rinderpest and peste des petits ruminants using PCR.** Couacy-Hymann, E. (Ministere de l'Agriculture et des Resources Animales, Bingerville (Cote d'Ivoire). Lab. Central de Pathologie Animale); Libeau, G.; Diallo, A.; Lefevre, P.C. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (In French). (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). In *The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. Proceedings of a research co-ordination meeting of the FAO/IAEA/SIDA/OAU/IBAR/PARC co-ordinated research programme.* 239p. Order Number DE95618235. Source: OSTI; NTIS (US Sales Only); INIS.

Viral RNA was extracted using glass beads. The method is rapid, simple and reproducible. Primer pairs B12/B2 amplified 273 bp nucleotides situated on the terminal N part of the N gene of the RPV. The primes do not amplify the N gene of PPRV, while a P1/P2 primer pair amplifies only a 295 bp fragment of the PPRV N gene and not the N gene of the RPV. The results show the specificity of each of the primer pairs. PCR was simplified to a degree that it can be used in African laboratories. The rinderpest campaign has now reached a stage where this technique is necessary. (author). 4 refs, 8 figs.

11026 (IAEA-TECDOC–772, pp. 219-225) **Serosurveillance for antibodies to rinderpest and peste de petits ruminants in bovins and small ruminants in Mali.** Tounkara, K. (Laboratoire Central Veterinaire, Bamako (Mali)); Traore, A.; Traore, A.P.; Samake, K.; Sidibe, S.; Traore, H.K.; Diallo, M.; Maiga, S.; Seck, B.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (In French). (CONF-9311283–: Research co-ordinated meeting on the sero-monitoring of rinderpest throughout Africa. Phase two, Cairo (Egypt), 7-11 Nov 1993). In *The sero-monitoring of rinderpest throughout Africa. Phase two. Results for 1993. Proceedings of a research co-ordination meeting of the FAO/IAEA/SIDA/OAU/IBAR/PARC co-ordinated research programme.* 239p. Order Number DE95618235. Source: OSTI; NTIS (US Sales Only); INIS.

567 sera from 58 herds of small ruminants showed a very low prevalence of rinderpest antibodies (2 sera positive). The prevalence of antibodies to peste des petits ruminants (PPR) was very high and in the region of Segou only 7 herds were negative. The study of bovine sera included 436 sera from 15 herds with a low antibody prevalence to rinderpest. The prevalence of antibodies to rinderpest was very low (8 positive sera). These results would indicate that in Mali PPR infection in small ruminants only very occasionally infects cattle and would have a negligible effect on a rinderpest vaccination programme. (author). 3 refs, 9 tabs.

11027 (IAEA-TECDOC–772, pp. 227-233) **The sero-monitoring of peste des petits ruminants antibodies in small ruminants and in cattle population with low prevalences of antibodies to rinderpest.** Ngangnou, A. (Laboratoire National Veterinaire, Garoua (Cameroon)); Zoyem, N.; Abdoul Kadiri, S. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Nov 1994. (In French). Proceedings of a research co-ordination meeting of the FAO/IAEA/SIDA/OAU/IBAR/PARC co-ordinated research programme.* 239p. Order Number DE95618235. Source: OSTI; NTIS (US Sales Only); INIS.

2010 sera samples from 68 non protected herds were tested against peste de petits ruminants virus antibodies (PPRVA) using CAMDA/OIE PPR ELISA kit, provided by EMVT/CIRAD. 91 samples (4.5%) were positive and the differences between provinces are statistically significant. The thermostable rinderpest vaccine produces in LANAVET was tested on field conditions. 109 cattles from SABGA zootechnical and veterinary center in the North-West province were vaccinated using thermostable rinderpest vaccine. 94 sera samples collected before and after vaccination were tested against RPVA using IAEA/FAO rinderpest vaccine. 94 sera samples collected before and after vaccination were tested against RPVA using IAEA/FAO rinderpest ELISA kit: 84 animals (89.3%) were positive. 813 sera samples collected from small ruminants in soudano-sahelian sub-population distributed into 43 herds were tested against PPRVA using CAMDA/OIE PPR ELISA kit (CIRAD/EMVT production). 181 sera were positive (22% prevalence), with 46% sheep and 14% goats. (author). 3 refs, 3 figs, 9 tabs.

11028 (INIS-BR–3469) **Dynamic of N fertilizers: urea (^{15} N) and aqua ammonia (^{15} N) incorporated to the sugar cane soil. Final report.** Trivelin, P.C.O. (Centro de Energia Nuclear na Agricultura (CENA), Piracicaba, SP (Brazil)). Fundacao de Estudos Agrarios Luiz de Queiroz, Piracicaba, SP (Brazil); Centro de Energia Nuclear na Agricultura (CENA), Piracicaba, SP (Brazil). May

1988. 87p. (In Portuguese). Order Number DE95621212. Source: OSTI; NTIS (US Sales Only); INIS.

The dynamic of N fertilizers, urea and aqua ammonia, in the soil of sugar cane crops are studied with an emphasis on the horizontal and vertical moving. The nitrogen routing from urea and aqua ammonia sources, by isotopic technique with ^{15} N in relation to the leaching, volatilization and extraction by the cultivation and residue of N immobilized manure in the soil with sugar cane plantation is also analysed. (C.G.C.).

11029 (INIS-mf–14413) **Animal production and health newsletter. No. 20.** Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 27p. Order Number DE95621222. Source: OSTI; NTIS (US Sales Only); INIS.

The activities of the Animal Production and Health Section of the Joint FAO/IAEA Division are carried out through the operation of Co-ordinated Research Programmes and Technical Co-operation projects, both of which aim to encourage and improve the capacity of national institutions in tropical and subtropical countries to identify and resolve problems connected with livestock development. This particular programme at the outset, it was envisaged that an inter-disciplinary approach would be adopted by each participating institute whereby studies on nutrition, reproduction and health would be integrated into a number of site specific projects. The one discussed in this newsletter covers animal production and focussing on animal reproduction and reproduction-nutrition interactions. This paper contains an outline for the program which encourages scientists from universities and research institutes to provide assistance and solutions to developing countries on the technical difficulties associated with artificial insemination.

11030 (INIS-mf–14414) **Mutation breeding newsletter. No. 41.** Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This newsletter contains short descriptions of research methods for the use of radiation to induce mutations and facilitate plant breeding. This method is used to develop species of plants that can survive in harsh climates and thus provide a food supply for humans and animals. Some of the mutants discussed include a salt tolerant barley, a disease resistant shrub, a cold tolerant chickpea, a highly productive Canavalia virosa and productive tomato. Refs, figs and tabs.

11031 (INIS-mf–14414, pp. 4) **Salt tolerance of the barley mutant 'Golden Promise'.** Forster, B.P. (Scottish Crop Research Inst., Scottland (United Kingdom). Cell and Molecular Genetics Dept.). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This short article provides a brief description of the development of a salt tolerant variety of barley. This salt tolerant barley, Golden Promise, is a mutation of another barley, Maythorpe. Golden Promise was developed by irradiating the seeds of Maythorpe. It has good malting and yield characteristics and will grow in soils containing high levels of sodium.

11032 (INIS-mf–14414, pp. 5) **Induction of shrubby type mutant in Stylosanthes guyanensis.** Alcantara, P.B. (Instituto de Zootecnia, Nova Odessa, SP (Brazil)); Mecelis, N.R.; Tulmann Neto, A.; Ghisi, O.M.A.A. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

The genus Stylosanthes Sw. is one of the most studied legumes in tropical countries because it has the potential for use as a pasture crop. This paper is a short summary of an effort to produce a strain of S. guyanesis which would be resistant to antrancnosis cause by Colletotrichum gloeosporioides. 1 ref, 1 tab.

11033 (INIS-mf–14414, pp. 6-7) **Induction of cold tolerance in Kabuli chickpea (Cicer arietinum L.) through induced mutations.** Haq, M.A. (International Centre for Agricultural Research in the Dry Areas (ICARDA), Aleppo (Syrian Arab Republic)); Singh, K.B. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This is a brief summary of work undertaken to produce a genetic variation of Kabuli chickpea which is resistant to Ascochyto blight and cold weather. The mutations were produced through irradiation with gamma radiations or EMS. 4 refs, 1 tab.

11034 (INIS-mf–14414, pp. 7-8) **Cowpea-88, a new mutant cultivar.** Sohoo, M.S. (Punjab Agricultural Univ., Ludhiana (India). Forage Research Unit); Bhardwaj, B.L.; Beri, S.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This is a short summary of the research used to develop a genotype of Vigna unquicultata which will give higher yields of green fodder and is also resistant to yellow mosaic virus and anthrocnose diseases. 2 refs, 2 tabs.

11035 (INIS-mf–14414, pp. 8-9) **'Noventa' - A new early mutant variety of soybean, Glycine max (L.) Merill.** Hoedosne-Kotvics, G. (University of Agricultural Science, Goedoelloe (Hungary). Dept. of Genetics and Plant Breeding); Heszky, L.E. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This is a brief summary a mutation breeding program involving soybeans. Genetic variability of plants were produced in soybean cultivars by irradiation with gamma radiation. The resulting genotype was an extremely early soybean cultivar with an improved characters for cool, long day-length, and short-growing season. 2 refs, 1 tab.

11036 (INIS-mf–14414, pp. 9-10) **Induction of variability in avocado (Persea americana Mill) by graftwood irradiation.** Rubi, A.M. (Fundacion Salvador Sanchez Colin (CICTAMEX), Mexico City (Mexico)); Cruz, E. de la; Sosa-CH, R.; Hernandez, A.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This is a short summary of experiments on avocado trees. The objective of this experiment was to obtain dwarf varieties or dwarfing rootstocks in order to reduce production costs, increase planting density and higher yield per hectare. 2 refs, 1 tab.

11037 (INIS-mf–14414, pp. 11) **Yield improvement of Canavalia virosa (Roxb). Wight et Am. by gamma ray induced mutations.** Rodriques, B.F. (S.P. Chowgule College, Margao Goa (India). Dept. of Botany); Torne, S.G. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This is a short summary of the use of radiation induced mutations to improve the yield of L-canavanine from the seeds of Canavalia virosa. This non protein amino acid is used extensively in biochemical research and has a potential insecticidal properties. 2 refs, 1 tab.

11038 (INIS-mf–14414, pp. 12) **Induced mutants in tomato.** Jayabalan, N. (Bharathidasan Univ., Tamil Nadu (India). Dept. of Botany); Rao, G.R. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This paper contains a brief description of research designed to improve the productivity of Lycopersicon esculentum Mill, a variety of tomato. The task was to produce a more productive variety that was disease resistant and early maturing. 1 tab.

11039 (INIS-mf–14414, pp. 13-14) **Mutant heterosis and production of F_1-performing DH lines.** Maluszynski, M. (Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Plant Breeding and Genetics Section); Szarejko, I.

Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This paper contains a short discussion on heterosis in crosses between mutants with the parent variety. The significant effect of heterosis in these crosses was described for such characters as plant yield, plant height, leaf and flower size, tillering, root system, seed protein content, and net assimilation rate. 2 refs, 1 fig.

11040 (INIS-mf–14414, pp. 15-16) **Gamma ray and ultrasound induced male sterility in sunflower.** Christov, M. (Institute of Wheat and Sunflower "Dobroudja", General Toshevo (Bulgaria)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This paper contains a brief description of the procedures use to produce gamma ray and ultrasound induced male sterility in sunflowers. 1 tab.

11041 (INIS-mf–14414, pp. 19) **Induction of mutation in jute by pollen irradiation.** Chattopadhyay, S. (Jute Agricultural Research Inst., Barrackpore (India)); Mitra, G.C. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

This paper contains a brief description of the induction of mutants through irradiating pollen. The basis for the experiment was to improve the yield of jute, the most important bast fibre crop in commerce. 1 ref., 1 tab.

11042 (INIS-mf–14414, pp. 20) **Effect of gamma radiation on Corchorus olitorius L.** Adetula, O.A. (National Horticultural Research Inst., Ibadan (Nigeria)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

A short paragraph on the irradiation of the seeds of Corchorus olitorius, an important vegetable in Nigeria. The irradiation was used to break dormancy. 2 refs.

11043 (INIS-mf–14414, pp. 20-22) **Report of ESNA working group 4 plant genetics, breeding and physiology.** Schmidt, J. (Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1994. 38p. In *Mutation breeding newsletter. No. 41.* Order Number DE95621213. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. PLANT BREEDING/meetings; GENETICS; MEETINGS; RADIATION INDUCED MUTANTS

11044 (INIS-mf–14444) **Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.** Office of Atomic Energy for Peace, Bangkok (Thailand). 1986. 318p. (In English, Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

This conference contains papers on non-power applications of nuclear technology in agriculture and industry. These applications include irradiation of food for disinfestation and radiopreservation, radiation monitoring, and radiation chemistry important to industrial processes.

11045 (INIS-mf–14444, [pp. 18]) **Effects of land preparation and maize cultivar on efficiency of N-fertilizer in maize-mungbean intercrop using 15N.** Suwanarit, A. (Dept. of Soils, Kasetsart Univ. (Thailand)); Suwanarat, C.; Chotchungmaneerat, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1986. 318p. (In Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). In *Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.* Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

A field experiment was conducted using ^{15}N-labelled urea on a reddish brown lateritic (peleustult) soil. Growing two crops on flat land and on soil ridges of 15 cm height produced similar comparative effects from fertilizer on maize. However, fertilizer applied by broadcasting on maize with a 50 cm effective band followed by incorporating was more useful to mungbean than that applied by bandling below the cereal seed rows when crops were grown on flat land. The reverse was observed when crops were grown on ridges. It was deduced that the maize cultivar was not likely to affect comparative efficiencies of fertilizer. For fertilizer application at sowing, broadcasting in 50 cm maize effective band followed by incorporating was slightly superior to bandling below maize seed rows. Side-dressing of fertilizer to maize at 4 weeks after sowing was superior to application at sowing. Evenly split application, at sowing and at 4 weeks after sowing, was either only slightly superior or comparable to non-split application bandling below maize seed rows at sowing, depending on placement method of the first application. Soil moisture status as a possible factor rendering discrepancy in the comparative efficiencies obtained by different authors is discussed.

11046 (INIS-mf–14444, [pp. 13]) **Quarantine treatment of fruit fly, Dacus zonatus (Saunders) in fruits by gamma irradiation.** Sutantawong, M.; Segsarnviriya, S.; Luangapichaikul, M.; Limopasmanee, W. Office of Atomic Energy for Peace, Bangkok (Thailand). 1986. 318p. (In Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). In *Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.* Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

Study on the utilization of both irradiated and non-irradiated sludges and waste waster as alternative fertilizer for morning glory was conducted. Korat Soli and Kui-Pai soil sets were used. This experiment was conducted at the Office of Atomic Energy for Peace during July to August 1983 by completely randomized design. The total of 6 treatments was consisted of 1 check without fertilizer and 5 fertilizers which are urea (46%N), irradiated and non-irradiated waste waters and irradiated and non-irradiated sludge. One liter of irradiated and non-irradiated waste water, urea solution (16 grams in 10 liters of water), irradiated and non-irradiated sludge (sludge:soil =1:7) were added to the soil. The height of morning glory at 7, 12, 17, 22, 27, and 32 days after planting were recorded. Plants grown on both irradiated and non-irradiated sludges were taller than those grown on soil with other fertilizers and check. Fresh and dry top weight of morning glory grown on irradiated and non-irradiated sludges were heavier than those grown on other fertilizers and check. Furthermore, it was also found that the growth rate of the top was greater than the root. In contrast, there is no significant difference between irradiated and non-irradiated sludges for using as fertilizer. It is concluded that irradiated sludge can be used as alternative source of fertilizer.

11047 (INIS-mf–14444, [pp. 10]) **Effects of gamma radiation on fruit flies pupae, Dacus dorsalis Hendel and Dacus zonatus (Saunders).** Kaochong, P. Office of Atomic Energy for Peace, Bangkok (Thailand). 1986. 318p. (In Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). In *Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.* Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

The 1, 3, 6, 8-day-old (+-4 hr) and 1, 3, 6, 7-day-old (+-4 hr) pupae of Dacus dorsalis Hendel and Dacus zonatus (Saunders) were irradiated in air with gamma rays from cobalt-60 source. The results showed that the LD_{50} and LD_{95} for 1, 3, 6 and 8-day-old (+-4 hr) D. dorsalis pupae were 18.6, 29.9, 3.11, 560.7 and 36.7, 72.9, 621.4, 884.6 Gray respectively. The LD_{50} and LD_{95} for 1, 3, 6 and 7-day-old (+-4 hr) D. zonatus pupae were 8.88, 25.3, 226.6, 546.6 and 16, 75.2, 427.5, 958.4 Gray respectively. Radiation dose at 90.3 and 89.7 Gray sterilized 100% D. dorsalis and D. zonatus males emerged from pupae 2 days before emergence respectively. In addition, D. dorsalis and D. zonatus females emerged from pupae irradiated at 60 and 40 Gray were unable to lay eggs respectively.

11048 (INIS-mf–14444, [pp. 5]) **Sperm transfer of gamma irradiated male fruit fly Dacus zonatus (Saunders).** Luangapichaikul, M.; Sutantawong, M. Office of Atomic Energy for

Peace, Bangkok (Thailand). 1986. 318p. (In Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). In *Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.* Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

Sperm transfer of male fruit flies, Dacus zonatus (Saunders) emerged from 8-day-old pupae irradiated at 80 Gray were determined from amount of sperm in female spermatheca. The results showed that the amount of sperms of 10, 15 and 30-day-old sterilized males were not significant difference from normal males ($P>0.05$). However, the sperms of 20 and 25-day-old sterilized males were less numerous than these normal males ($P<0.05$).

11049 (INIS-mf–14457) **Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.** Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). Order Number DE95620176. Source: OSTI; NTIS; INIS.

A critical review of medical sterilization methods commercially used has been done. On this base scientific, technical and production aspects of radiation sterilization technology have been discussed. Especially the process control, dosimetric methods used and microbiological problems were described. All legal aspects, Polish and international regulations and licensing procedures for different kinds of medical materials have been also shown. The development of radiation sterilization in Poland in respect to dressings, tissue transplants, cosmetics, tissue transplants, cosmetics, pharmaceutics, packing materials as well as other radiation technologies has been presented.

11050 (INIS-mf–14457, pp. 5-12) **Sterilization of medical equipment. Review of methods.** Stachowicz, W. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

A review of physical, mechanical and chemical methods for sterilization of equipment has been presented. Radiation sterilization is one of the physical methods. In this technique gamma rays, X-rays and electron beam from accelerators have been utilized. Variants of the sterilization methods have been described and discussed. 1 fig., 1 tab.

11051 (INIS-mf–14457, pp. 13-21) **Radiosterilization and other sterilization methods of medical equipment on Kilmer's conference, Brussels, 12-16 June 1993.** Zagorski, Z.P. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

The Johnson and Johnson Co. organized the scientific conference devoted to different aspects and methods of sterilization of medical equipment and materials. A condensed review of the main problems discussed during the conference has been done. Attention has been paid especially on: actual problems with primary infections control, problems of sterilization in pharmacy, hazards problems, investigations and control methods and radiation sterilization. 2 figs.

11052 (INIS-mf–14457, pp. 23-31) **Microbiological problems in radiosterilization.** Czerniawski, E. (Lodz Univ. (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

Criteria for medical materials sterilization from the view point of sanitary-hygiene aspects have been broadly discussed. More important problems have been pointed out as follows: assurance of proper hygienic conditions in production, pharmacopoeia rules and regulations compliance, physico-chemical and biological investigations of each new material and product. 19 refs, 4 figs, 3 tabs.

11053 (INIS-mf–14457, pp. 33-36) **The irradiation and sterilization process control.** Panta, P.P. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

Radiation sterilization requires the absolute calibration of electron beam and routine dosemeters. Water - calorimeter, Fricke dosemeter and routine dosemeters such a PVC foil and alanine dosemeter and others have been used for these purposes. All irradiated materials should have a proper indicator for absorbed dose control.

11054 (INIS-mf–14457, pp. 49-55) **Radiosterilization in practice of tissue banking.** Komender, J. (Akademia Medyczna, Warsaw (Poland)); Komender, A. Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

The use of radiosterilization for preparing tissues for banking has been described. The legal aspects of tissue banking in Poland have been presented as well as institutions being responsible for collecting, preparing and banking the main tissues for medical use. The influence of ionizing on bio-static transplants during their sterilization as well as methods for their investigation have been discussed. Results of 1014 patients attendance after transplantation of bio-static bones have been also presented.

11055 (INIS-mf–14457, pp. 57-61) **Packing materials.** Kubera, H. Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

Medical materials and equipment should be sterilized before their use. The treatment by irradiation create a convenient situation when products can be sterilized after their sealing in packing. A review of packing materials most often used and their radiation resistance has been done. The selection of proper packing material has been discussed from the view point of kind of medical material and of radiation sterilization conditions needed. 2 tabs.

11056 (INIS-mf–14457, pp. 89-101) **Radiation treatment of pharmaceutics, raw materials for medical use and cosmetics.** Bryl-Sandelewska, T. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school.*

Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993. Order Number DE95620176. Source: OSTI; NTIS; INIS.

A review of worldwide use of radiation technologies for sterilization of raw materials indispensable in pharmacy as well as in industry of medical accessories and cosmetics has been done. Investigations and dose recommendations assortments accepted by different countries have been introduced. On that background the Polish activity in this topic has been shown. 19 refs, 2 figs, 4 tabs.

11057 (INIS-mf–14457, pp. 103-109) **Radiosterilization facility for medical supplies and transplants.** Zimek, Z. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

The facility for radiosterilization of medical materials and transplants has started to work in 1993 at the Institute Nuclear Chemistry and Technology, Warsaw. The parameters of electron beam accelerator as well as other equipment necessary for radiation processing have been described. Lists of medical products which can be sterilized there as well as of cooperating. Institutions have been also included. 2 figs, 3 tabs.

11058 (INIS-mf–14457, pp. 115-120) **Economic aspects of radiosterilization.** Zimek, Z. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

Economic aspects of different versions of radiosterilization technology have been discussed. Especially the use of electron beam from linear accelerators has been presented from view point of cost estimation. Calculations have been based on the Institute of Nuclear Chemistry and Technology, Warsaw, experience during design and building a new facility for radiosterilization of medical equipment and materials. The facility has been finished in 1993 in under operation now. 3 tabs.

11059 (INIS-mf–14464) **Ammonium sulphate and urea use efficiency in wheat (triticum aestivum) through isotope dilution method.** Ciencia y Tecnologia Nuclear, v. 11-2. Alfaro, M.A. (Seccion Agropecuaria, Direccion General de Energia Nuclear (Guatemala)); Pappa, J.L.; Aldana, F. Direccion General de Energia Nuclear, Guatemala City (Guatemala); Instituto de Ciencia y Tecnologia Agricula (ICTA), Guatemala City (Guatemala). 1993. 6p. (In Spanish). Sponsored by Direccion General de Energia Nuclear, Guatemala City (Guatemala). Order Number DE95618226. Source: OSTI; NTIS (US Sales Only); INIS.

Two field experiments were carried out to evaluate the use efficiency of nitrogen fertilizer in wheat crop, using urea and ammonium sulphate 5% N-15 atom excess. The experiments were conducted at the ICTA Experimental Center 'Labor Ovalle', Quetzaltenango. In one of them, the time of the largest use efficiency by the crop was determined, for which three times of applications were evaluated: at sowing, 35 and 55 days after sowing with a total rate of 100 kg nitrogen per hectare, applying fertilizer dissolved in water. In the other experiment the application of fertilizer solid and dissolved in water was compared. The use efficiency was similar for nitrogen sources, but not for time and type of application being 35 days and fertilizer dissolved the treatments with best use efficiency.

11060 (INIS-mf–14467) **Radiation effect in another culture rice (Oryza Sativa L.) variety Krispo-38.** Ciencia y Tecnologia Nuclear, v. 11-2. Montepeque, R. (Seccion Agropecuaria, Direccion General de Energia Nuclear (Guatemala)); Molina, L.G.; Lopez, J.J.; Pazos, W.; Ramirez, J. Direccion General de Energia Nuclear, Guatemala City (Guatemala); Instituto de Ciencia y Tecnologia Agricula (ICTA), Guatemala City (Guatemala). 1993. 3p. (In Spanish). Sponsored by Direccion General de Energia Nuclear, Guatemala City (Guatemala). Order Number DE95618227. Source: OSTI; NTIS (US Sales Only); INIS.

Seeds of the rice variety Krispo-38 were irradiated with 0, 100, 200, 300 and 400 Gray (Gy) and sown in the greenhouse. From each treatment, others containing uninucleate pollen grains were collected and cultured on a N6 agar medium with 5% sucrose concentration and supplemented with mg/l naphthalene acetic acid (NAA), 1 mg/l kinetin and 1 mg/l 2,4 dichlorophenoxyacetic acid (2,4-D). The pollen grains were induced to develop callus. The percentage of others that produced calli varied from 0.8 for the 400-Gy treatment to 3.3% for the control. The calli were transferred to N6 medium with 3% sucrose concentration, supplemented with 0.5 mg/l NAA and 1 mg/l kinetin. The percentage of calli that produced green plants varied from 1.9 for the 300-Gy treatment to 10.5 for the 200 Gy treatment. Plants developed in 2-5 weeks after callus transplant. A total of 101 green plants was obtained.

11061 (INIS-mf–15047) **Thermoluminescence of irradiated foods.** SozEp-Hefte, v. 10/1993. Wagner, U.; Helle, N.; Boegl, K.W.; Schreiber, G.A. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Sozialmedizin und Epidemiologie. 1993. 37p. (In German). Order Number DE95746655. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes developments and applications of the thermoluminescence (TL) analysis of mineral contaminants in foods. Procedures are presented to obtain minerals from most different products such as pepper, mangos, shrimps and mussels. The effect of light exposure during the storage of foods on the TL intensity of minerals is examined and corresponding conclusions for routine control are drawn. It is also shown that the normalization of TL intensities - the essential step to identify irradiated samples - can not only be achieved by γ, X or β rays but also by UV radiation. The results allow the conclusion that a clear identification of any food which has been irradiated with more than 1 kGy is possible if enough minerals can be isolated. (orig.)

11062 (INIS-mf–15052) **Thermoluminescence analysis to detect irradiated fruit and vegetables - an intercomparison study. A report in English and German.** SozEp-Hefte, v. 3/1993. Schreiber, G.A.; Wagner, U.; Helle, N.; Ammon, J.; Buchholtz, H.V.; Delincee, H.; Estendorfer, S.; Grabowski, H.U. von; Kruspe, W.; Mainczyk, K.; Muenz, H.; Schleich, C.; Vreden, N.; Wiezorek, C.; Boegl, K.W. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Sozialmedizin und Epidemiologie. 1993. 140p. (In English, German). Order Number DE95746660. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes in detail an intercomparison study to detect the irradiation of fruit and vegetables with a dose upwards of approx. 1 kGy. The 12 participating laboratories determined the thermoluminescence (TL) of mineral contaminations isolated from coded samples. Papayas, mangos, strawberries and mushrooms, which were either non-irradiated or irradiated with doses of between 1.4 and 1.6 kGy were chosen for examination as well as potatoes, which were either nonirradiated or treated with 200 Gy (for prevention of germination). The results of this intercomparison study were largely identical with those of the thermoluminescence intercomparison study on spice products. Therefore, it was applied to publish the method in the official collection of methods under article 35 of the German Foods Act (LMBG). In this method the integration of glow curves in a certain temperature range is recommended. The threshold value for the TL signal to distinguish irradiated and non-irradiated samples is fixed at 0.6. Under these conditions, all the non-irradiated samples in this intercomparison study and approx. 66% of the samples irradiated with doses of 1.4 to 1.6 kGy would have been correctly identified. As expected, the potato samples treated with a 200 Gy dose were not recognized as irradiated after normalization of the TL intensity using a re-irradiation dose of 1 kGy. Nevertheless, much higher TL intensities were recorded for the irradiated samples than for the non-irradiated samples in the first TL reading. By using different re-irradiation

doses for the same mineral sample or by determining the re-irradiation dose that is required to obtain a TL signal value of approx. 1, however, it is possible to detect samples given a dose of below 1 kGy. The doses used to irradiate these samples can probably also be determined. The report deals briefly with this modified normalization procedure. (orig./VHE)

11063 (BARC–1994/E/018) **Leukemia data analysis for fast neutron RBE- a simplified approach for radiation protection.** Marathe, P.K. (Bhabha Atomic Research Centre, Bombay (India). Radiation Protection Services Division); Massand, O.P.; Venkataraman, G.; Unnikrishnan, G.; Krishnan, D. Bhabha Atomic Research Centre, Bombay (India). 1994. 22p. Order Number DE95618341. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of fast neutron RBE at low doses is reinvestigated in the light of revised A-bomb dosimetry. Instead of dose dependent RBE based on discrete dose points, a constant neutron RBE appropriate to low dose range is recommended based on linear non-threshold gamma risk for leukemia. A non-linear function for gamma induced carcinogenesis has the associated problem of accounting for dose and dose rate effectiveness factor (DDREF) which is assumed to be unity for high LET radiation (fast neutron). A simplified linear dose response for both types of radiation, yields RBE values which may be a pointer to selection of suitable quality factor (QF) values in radiation protection. (author). 11 refs., 3 figs., 4 tabs., appendix.

11064 (BNL–61279) **Boron dose determination for BNCT using Fricke and EPR dosimetry.** Wielopolski, L. (Brookhaven National Lab., Upton, NY (United States)); Ciesielski, B. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9410281–2: 6. international symposium on neutron capture therapy for cancer, Kobe (Japan), 31 Oct - 4 nov 1994). Order Number DE95005966. Source: OSTI; NTIS; INIS; GPO Dep.

In Boron Neutron Capture Therapy (BNCT) the dominant dose delivered to the tumor is due to α and ^{7}Li charged particles resulting from a neutron capture by ^{10}B and is referred to herein as the boron dose. Boron dose is directly attributable to the following two independent factors, one boron concentration and the neutron capture energy dependent cross section of boron, and two the energy spectrum of the neutrons that interact with boron. The neutron energy distribution at a given point is dictated by the incident neutron energy distribution, the depth in tissue, geometrical factors such as beam size and patient's dimensions. To account for these factors can be accommodated by using Monte Carlo theoretical simulations. However, in conventional experimental BNCT dosimetry, e.g., using TLDs or ionization chambers, it is only possible to estimate the boron dose. To overcome some of the limitations in the conventional dosimetry, modifications in ferrous sulfate dosimetry (Fricke) and Electron Paramagnetic Resonance (EPR) dosimetry in alanine, enable to measure specifically boron dose in a mixed gamma neutron radiation fields. The boron dose, in either of the dosimeters, is obtained as a difference between measurements with boronated and unboronated dosimeters. Since boron participates directly in the measurements, the boron dosimetry reflects the true contribution, integral of the neutron energy spectrum with boron cross section, of the boron dose to the total dose. Both methods are well established and used extensively in dosimetry, they are presented briefly here.

11065 (CNEN-IT–01/91) **Radiation protection and safety for final disposal of radioactive wastes stored in Abadia de Goias, Brazil.** Comissao Nacional de Energia Nuclear (CNEN), Rio de Janeiro, RJ (Brazil). Dept. de Normas e Especificacoes. 1991. 37p. (In Portuguese). (CNEN-DNE–46.). Order Number DE95621240. Source: OSTI; NTIS (US Sales Only); INIS.

This standard aims to satisfy the radiation protection and safety conditions required by Brazilian Nuclear Energy Commission (CNEN) for final disposal of radioactive wastes stored in Abadia de Goias. These wastes are products of the accident happened in 1987 caused by the Cs-137 source violation. (M.V.M.).

11066 (CNIC–00770) **Experimental studies on anti-oxidants reducing lipid peroxidation of irradiated mice.** Du Zeji (Suzhou Medical Coll., JS (China)); Liu Keliang; Su Liaoyuan. China Nuclear Information Centre, Beijing, BJ (China). Aug 1993. 7p. (In Chinese). (SMC–0098.). Order Number DE95612491. Source: OSTI; NTIS (US Sales Only); INIS.

The free radical plays an important role in the irradiation damage. The irradiation damage would be reduced if anti-oxidants is used, because anti-oxidants can scavenge free radicals and suppress lipid peroxidation. In the study, a fluoro-spectrophotometer was used to determine the changes of MDA levels in mice tissues and serum after irradiation and the protective effect of anti-oxidants of Vit E and DMSO on damage caused by free radicals. The results are as follows: (1) The highest MDA level was at 12 to 24 hours after irradiation dose of 3.0 Gy. (2) The MDA level is increasing with the increasing of irradiation dose. It means the MDA level can indicate the extent of irradiation damage. (3) Both Vit E and DMSO had a powerful effect on reducing MDA level, but the effect of DMSO was stronger than Vit E. The optimum doses of them were 0.25 mg/g body weight and 10 mg/g body weight respectively. (4) The best effect obtained was to use Vit E and DMSO simultaneously.

11067 (CONF-9304128–22) **Calibration and operation of continuous air monitors for alpha-emitting radionuclides.** Hoover, M.D.; Newton, G.J. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE95006165. Source: OSTI; NTIS; INIS; GPO Dep.

Spectrometer-based continuous air monitors have improved our capabilities for detecting aerosols of alpha-emitting radionuclides. This paper describes basic requirements and statistical limitations in the sensitivity of alpha continuous air monitors, and presents a technical basis for selecting the energy window for detection of uranium and plutonium aerosols, correcting for interference from airborne dust, selecting filters with low pressure drop and good front surface collection characteristics, and properly using electroplated calibration sources. Sensitivity limits are described for detecting uranium or plutonium aerosols in the presence of increased concentrations of naturally occurring, alpha-emitting radon progeny radionuclides. Decreasing the lower energy boundary of the detection window from 4.3 MeV to 2.7 MeV improves by a factor of three the detection of plutonium in the presence of dust, while causing minimal additional interference from ambient radon progeny. Selection of the Millipore Fluoropore teflon membrane filter reduces both pressure drop and interference from ambient radon progeny by up to a factor of two. Field collection of ambient radon progeny can be used to verify the proper energy of alpha emissions from electroplated calibration sources. In the absence of energy verification, errors in instrument calibration may result from solid state diffusion of the electroplated calibration radionuclide into the substrate plate.

11068 (CONF-9304128–23) **Dissolution rate and radiation dosimetry of metal tritides.** Cheng, Y. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). [1993]. 15p. DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE95006162. Source: OSTI; NTIS; GPO Dep.

Metal tritides including titanium tritide (Ti^3H_x) and erbium tritide (Er^3H_x) have been used as components of neutron generators. These compounds can be released to the air as aerosols during fabrication, assembling, and testing of components or in accidental or fugitive releases; as a result, workers may be exposed to these compounds by inhalation. A joint research project between Sandia National Laboratories and the Inhalation Toxicology Research Institute was initiated to investigate the solubility of metal tritide particles, to determine retention and translocation of inhaled particles in animals, and to develop an internal dosimetry model. The current understanding of metal tritides and their radiation dosimetry for internal exposure is very limited. The ICRP Report 30 does not provide for tritium dosimetry in metal tritide form. The current radiation protection guidelines for metal tritide particles are based on the assumption that the biological behavior is similar to tritiated water which could be easily absorbed into body fluid, and therefore, a relatively short biological half life (10 days). If the solubility is low, the biological half life of metal tritide particles and the dosimetry of inhalation exposure to these particles could be quite different from tritiated water. This would have significant implications in the current health protection guidelines including annual limits of intakes and derived air concentrations. The preliminary results of our metal tritide dissolution study indicated that the solubility of titanium tritide is low.

11069 (CONF-9304128–24) **A case study on determining air monitoring requirements in a radioactive materials handling area.** Newton, G.J. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States)); Bechtold, W.E.; Hoover, M.D.; Ghanbari, F.; Herring, P.S.; Jow, Hong-Nian. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE95006164. Source: OSTI; NTIS; INIS; GPO Dep.

A technical, defensible basis for the number and placement of air sampling instruments in a radioactive materials handling facility was developed. Historical air sampling data, process and physicochemical knowledge, qualitative smoke dispersion studies with video documentation, and quantitative trace gas dispersion studies were used to develop a strategy for number and placement of air samplers. These approaches can be used in other facilities to provide a basis for operational decisions. The requirements for retrospective sampling, personal sampling, and real-time monitoring are included. Other relevant operational decisions include selecting the numbers, placement, and appropriate sampling rates for instruments, identifying areas of stagnation or recirculation, and determining the adequacy and efficiency of any sampling transport lines. Justification is presented for using a graded approach to characterizing the workplace and determining air sampling and monitoring needs.

11070 (DOE-EM-STD–5503-94) **EM Health and Safety Plan Guidelines.** USDOE, Washington, DC (United States). Dec 1994. 211p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004760. Source: OSTI; NTIS; GPO Dep.

This document contains information about the Health and Safety Plan Guidelines. Topics discussed include: Regulatory framework; key personnel; hazard assessment; training requirements; personal protective equipment; extreme temperature disorders or conditions; medical surveillance; exposure monitoring/air sampling; site control; decontamination; emergency response/contingency plan; emergency action plan; confined space entry; and spill containment.

11071 (DOE/ER/61529–T1) **Electron transport calculations with biomedical and environmental applications. Final report, December 23, 1992–January 31, 1994.** Seltzer, S.M. National Inst. of Standards and Technology (IMSE), Gaithersburg, MD (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI02-93ER61529. Order Number DE95007065. Source: OSTI; NTIS; INIS; GPO Dep.

The general objective of this project has been to carry out studies of radiation interactions with matter, and of radiation transport in bulk media, in order to generate basic radiological physics information needed as input for: Biomedical radiation dosimetry, Assessment of radiation hazards in nuclear technology, Modeling of biological radiation action. This work has included the development of transport-theoretic methods, the compilation and critical evaluation of the underlying single-scattering cross sections, and the application of the transport methods to radiological physics problems. The project carried out for DOE has been closely related to other projects of the Radiation Interactions and Dosimetry Group of the Ionizing Radiation Division supported in-house by NIST (radiation standards for medical and industrial applications). It has shared with these projects mathematical methods, computer programs, and cross section data bases. The support from DOE has covered approximately 20% of the activities in the radiation transport area by the Radiation Theory Task. The research for DOE was carried out by S. M. Seltzer and M. J. Berger.

11072 (EGG–2744, pp. 185-192) **Dose effect comparisons between HFR and BMRR irradiated dogs with respect to healthy tissue tolerance.** Huiskamp, R. (Netherlands Energy Research Foundation, Petten (Netherlands)); Philipp, K.H.I.; Gavin, P.R.; Wheeler, F.J.; Siefert, A. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Epithermal neutrons beams are being developed for the application of boron neutron capture therapy (BNCT) of deep seated tumors, like glioblastoma and astrocytomas, through the intact skin. Epithermal neutrons will be moderated by the tissue mass between skin and tumor to produce the thermal neutrons necessary for the $^{10}B(n, \alpha)^7Li$ reaction in the target tissue. Although the neutron capture cross-sections of elements in normal tissue are several orders of magnitude lower that for boron, the high abundance of hydrogen and nitrogen will cause a significant contribution to the total absorbed radiation dose through the $^1H(n, \gamma)^2H$ and the $^{14}N(n, p)^{14}C$ reaction, respectively. Due to inevitable incomplete filtration, an epithermal beam will also contain a fast neutron component, i.e. neutrons with energies $\geq$ 10 keV, and a γ-photon component originating from the reactor and produced in structural and filter materials. Therefore, the resultant radiation consists of a complex of low and high LET radiation of which the constituents vary rapidly with depth in tissue. Together with the dependence of the biological effects on the extra- and intracellular localization of boron, the assessment of the tolerance of normal tissues in large animal models necessary prior BNCT with borocaptate sodium (BSH) of brain tumors is very complicated. The present paper describes preliminary dose effect comparisons between High Flux Reactor (HFR) and Brookhaven Medical Research Reactor (BMRR) irradiated dogs with respect to healthy tissue tolerance in order to refine the borocaptate sodium (BSH) compound factors and the fast neutron RBE for skin and brain.

11073 (EGG–2744, pp. 225-606) **Determination of fast-neutron dose distributions in the canine central nervous system.** Nigg, D.W. (Idaho National Engineering Lab., ID (United States)); Moran, J.M.; Wheeler, F.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) Center for Boron Neutron Capture Therapy (BNCT) Measurement and Development conducts, sponsors, and coordinates research and development efforts in a variety of BNCT-related areas. Current activities include an ongoing series of large-animal (canine) model irradiation experiments conducted in collaboration with the Washington State University School of Veterinary Medicine. These experiments employ the epithermal-neutron beam at the Brookhaven Medical Research Reactor (BMRR) and have the purpose of determining normal tissue tolerance and spontaneous brain tumor response to the unique mix of radiation components that characterize BNCT. Results of exploratory calculations to determine the peak central nervous system fast neutron dose for canine subjects with and without scalp and temporal muscle reflection have been completed and are summarized here.

11074 (EGG-M–94197) **Improvements in patient treatment planning systems.** Wheeler, F.J. (Idaho National Engineering Lab.,

Idaho Falls, ID (United States)); Wessol, D.E.; Nigg, D.W.; Atkinson, C.A.; Babcock, R.; Evans, J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9410281–3: 6. international symposium on neutron capture therapy for cancer, Kobe (Japan), 31 Oct - 4 nov 1994). Order Number DE95005034. Source: OSTI; NTIS; INIS; GPO Dep.

The Boron Neutron Capture Therapy, Radiation treatment planning environment (BNCT-Rtpe) software system is used to develop treatment planning information. In typical use BNCT-Rtpe consists of three main components: (1) Semi-automated geometric modeling of objects (brain, target, eyes, sinus) derived from MRI, CT, and other medical imaging modalities, (2) Dose computations for these geometric models with rtt-MC, the INEL Monte Carlo radiation transport computer code, and (3) Dose contouring overlaid on medical images as well as generation of other dose displays. We continue to develop a planning system based on three-dimensional image-based reconstructions using Bspline surfaces. Even though this software is in an experimental state, it has been applied for large animal research and for an isolated case of treatment for a human glioma. Radiation transport is based on Monte Carlo, however there will be implementations of faster methods (e.g. diffusion theory) in the future. The important thing for treatment planning is the output which must convey, to the radiologist, the deposition of dose to healthy and target tissue. Many edits are available such that one can obtain contours registered to medical image, dose/volume histograms and most information required for treatment planning and response assessment. Recent work has been to make the process more automatic and easier to use. The interface, now implemented for contouring and reconstruction, utilizes the Xwindowing system and the MOTIF graphical users interface for effective interaction with the planner. Much work still remains before the tool can be applied in a routine clinical setting.

11075 (ENEA-RT-AMB–93-21) **Evolution of radiation protection.** Gigna, A. (ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute). ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute. Jan 1994. 15p. (In Italian). (RT/AMB–93-21). Order Number DE95749703. Source: OSTI; NTIS (US Sales Only).

The evolution of radioecological research in the european countries is recorded, with some detail concerning the major goals achieved. The situation of italian activities in the radiation protection sector is also described in particular.

11076 (ENEA-RT-AMB–93-22) **Considerations on environmental aspects of radiation protection. Proceedings.** Cigna, A.A. (ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia e Innovazione). ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute. Dec 1994. 13p. (CONF-930181–3: Workshop on radiation protection toward the turn of the century, Paris (France), 11-13 Jan 1993; RT/AMB–93-22). Order Number DE95749677. Source: OSTI; NTIS (US Sales Only).

After a short history of radiation protection, the relationships between man and environment are considered. In particular it is discussed if the protection of man assures also the protection of the environment. Then the evolution of radioecological research is recorded with some details concerning the major goals achieved. Finally, the present situation of the radiation protection and the environment is considered emphasizing the important influence of politicians and authorities with relevant consequences on future standards of safety for the public.

11077 (ENEA-RT-AMB–94-23) **Absorbed dose per unit fluence for tissue equivalent slab phantoms for electron from 50 keV to 10 MeV.** Gualdrini, G.F. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); De Maio, U.; Padoani, F. ENEA, Bologna (Italy). Dec 1994. 189p. (RT/AMB–94-23). Order Number DE95749719. Source: OSTI; NTIS (US Sales Only).

After the publication of the 1990 Recommendations of the International Commission on Radiological Protection (ICRP 60), an ICRP/ICRU (International Commission on Radiation Units) joint task group was set up to revise the ICRP publication 51 data for use in protection against external radiation. The aim is to include the new computational evaluations of effective doses as well as the new calculated values of the operational quantities. In this framework particular interest was focused on the need of updating data for electron and beta radiation. A subgroup of the EURADOS WG4 (numerical dosimetry) was therefore created as a support to the ICRP/ICRU joint task group with the specific aim of providing conversion factors for operational quantities for electron and beta radiation. The ENEA (Italian Agency for New Technologies, Energy and the Environment) contribution to the task group dealt with the Monte Carlo analyses of electron absorbed dose for slab phantoms of different compositions, as a function of incident electron energy and angle for electron energies ranging from 70 keV to 10 MeV. The present paper summarises the complete set of results together with comparisons with data recently published by foreign laboratories.

11078 (ENEA-RT-INN–94-31) **Description of ELEBEAM calculation code.** Tata, A. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Beone, F.; Musciagna, A.; Palitto, M. ENEA, Casaccia (Italy). Area Energia e Innovazione. Oct 1994. 49p. (In Italian). (RT/INN–94-31). Order Number DE95749671. Source: OSTI; NTIS (US Sales Only).

The Italian National Agency for New Technologies, Energy and the Environment (ENEA), jointly cooperating with SRS/CONSIT Companies (Italy), developed the ELEBEAM calculation code. Such a code would represent a tool in both technical and economic assessment of hazardous waste treatment plants equipped with electron beam machines. In addition, the developed software allows the assessment of incoming and/or outgoing wastes flow by means of two separate databases: the first database contains information concerning treatment methods and results with reference to those hazardous compounds for which radiation treatment has been previously used. Mathematical correlation has been used to handle the data obtained by previous studies in order to integrated them in the data-base; the second data-base contains data referred to the maximum permissible discharge limit of considered waste flows. The program has been developed enhancing maximum interactivity with user: an on-line help system enables the user to quickly access necessary practical knowledge. The ELEBEAM code was developed with an introductory layout that enable assessment and definition of: clearances, studied data concerning hazardous waste compounds, the radiation section basic design, integrative treatments, capital and operation costs, compared to conventional technologies plants costs. Two application examples are presented: the first shows drinking water which has contaminated by atrazina, the second, wastes flow mates contaminated by PCBs (Polichlorobyphenils).

11079 (GSI–94-78(prepr.)) **LET-effects in DNA.** Kraft, G. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Taucher-Scholz, G.; Heilmann, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 15p. (CONF-9410280–: International workshop on radiation damage in DNA: relationships at early times, Gleneden, OR (United States), 1-6 Oct 1994). Order Number DE95752099. Source: OSTI; NTIS (US Sales Only); INIS.

In this contribution, an introductory view on the physical properties of ions is given and the cellular response to high LET radiation is summarized. Then the measurements of strand break induction of DNA in solution and in intracellular DNA are reported and compared to cell survival. The possibility of changes in the quality of the lesions is discussed and finally the present status of model calculations in comparison to the experiments is given. (orig./HSI)

11080 (GSI–94-79(prepr.)) **Analysis of native cellular DNA after heavy ion irradiation: DNA double-strand breaks in CHO-K1 cells.** Heilmann, J.; Taucher-Scholz, G.; Kraft, G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 9p. (CONF-9410280–: International workshop on radiation damage in DNA: relationships at early times, Gleneden, OR (United States), 1-6 Oct 1994). Order Number DE95752100. Source: OSTI; NTIS (US Sales Only); INIS.

A fast assay for the detection of DNA double-strand breaks was developed involving constant field gel electrophoresis (Taucher-Scholz et al., 1994) and densitometric scanning of agarose gels stained with ethidium bromide. With this technique, DSB induction was investigated after irradiation of CHO cells with carbon ions

with LET values between 14 keV/μm and 400 keV/μm. In parallel, a computer code was developed to simulate both the principle of the electrophoretic detection of DNA double-strand breaks and the action of radiations of different ionization density. The results of the experiments and the calculations are presented here and compared with each other. (orig./HSI)

11081 (GSI–94-81(prepr.)) **Detection of heavy ion induced DNA double-strand breaks using static-field gel electrophoresis.** Taucher-Scholz, G.; Heilmann, J.; Schneider, G.; Kraft, G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 13p. Order Number DE95752101. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation induced DNA double-strand breaks (DSBs) were measured in Chinese hamster ovary cells (CHO-K1) using an experimental protocol involving static-field gel electrophoresis following exposure to various accelerated ions. Dose-effect curves were set up and relative biological efficiencies (RBEs) for DSB induction were determined for different radiation qualities. RBEs around 1 were obtained for low energy deuterons (6-7 keV/μm), while for high energy oxygen ions (20 keV/μm) an RBE value slightly greater than 1 was determined. Low energetic oxygen ions (LET $\approx$ 250 keV/μm) were found to show RBEs substantially below unity, and for higher LET particles ($\geq$ 250 keV/μm) RBEs for DSB induction were generally found to be smaller than 1. The data presented here are in line with the generally accepted view that not induced DSBs, but misrepaired or unrepaired DNA-lesions are related to cellular inactivation. (orig.)

The results of environmental radiation monitoring that CETESB (Technological Company of Environmental Sanitation of Sao Paulo) does in influence areas of radioactive materials store of Nuclemon Minero-Quimica S.A. in the municipality of Itu, Sao Paulo State, are presented. The data comprises the period of 1983-1990 with information about concentration levels of radium-225 in underground and superficial waters of the region. On March, 1989, was detected contamination in a well near of the stores. The levels observed, its implications in terms of health risks and possible causes of event are discussed too. The goals that CETESB intends to reach in terms of monitoring of environmental radiation in Sao Paulo State are also presented. (C.M.).

11085 (INIS-BR–3471) **Recovery from DNA synthesis in V 79 chinese hamster cells irradiated with UV light.** Ventura, A.M. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1987. 134p. (In Portuguese). Order Number DE95621121. Source: OSTI; NTIS (US Sales Only); INIS.

Mammalian cells recover from DNA synthesis inhibition by UV light before most of the pyrimidine dimers have been removed from the genome. Most of the rodent cells show a deficient dimer excision repair compared with normal human fibroblasts. Despite this fact they recover efficiently from DNA synthesis inhibition after UV. In Chinese hamster V 79 cells was found that this recovery takes place in the absence of a significant excision repair, and it seems to be directly coupled to a recovery in the rate of movement of the replication fork. 120 refs, 31 figs. Owing to all hospitals throughout the Kingdom demand local produce of radioiodine-131 for diagnostic and treatment. Radioisotope Production Division, Office of Atomic Energy for Peace increases its production to meet the local need, thus the change of I-131 diffusion in air also increases. To minimize the risk of radiation effects to the health of personnel, a research project has been carried out and the determination of I-131 in urine excrete from the body in order to estimate the amount of I-131 inhale into the body. This is a preventive measure in case of receiving radiation dose that exceeds the hazard limit.

Physics Dept. 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

This conference involves subjects of radiation protection, programming of civil defence, on the implementation of 1990 ICRP recommendation, thermoluminescence properties of bone equivalent calcium phosphate ceramics, potassium body burdens in occupational users of egyptian nuclear research centre, transport of radionuclides in fresh water stream, water treatment process for nuclear reactor, research activities related to internal contamination and bioassay and experience and environmental radiation monitoring in inshass. it contains of figures and tables.

11090 (INIS-mf–14469, pp. 1-22) **Future scientific trends in radiation protection and civil defence.** Gomaa, M.A. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference*. Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the present study is to review current and future scientific trends in radiation protection and civil defence of the nuclear research center of the Atomic Energy Authority of Egypt. The main areas of interest are summarized as follows: 1. Organization and training: Up dating radiation protection legislation. Information transfer via translation to Arabic of latest IAEA and ICRP publications. Establishing data base for rad port services in egypt. Updating radiation protection training programmes, and application of decision-aiding techniques in radiation protection (justification and optimization). 2. Occupational radiation control: Mixed field external personnel dosimetry/detection. internal dosimetry/biophysics/ W B counter /Bioassay. Area monitoring and surface, and updating radiation format. 3. Public radiation control: Environmental programme around inshass reactor. Transport of radioactive material. Transfer of radioactivity in aquatic environments. storage of radioactive waste, and annual exposure to members of the public-natural radiation, medical others. 4. Emergency: First aids decontamination, decontamination of personnel and equipment, dose calculation after accidents, and Handling radiation accidents/ emergency planning. 5. Quality assurance: Calibration of radiation sources and measuring devices, and intercomparison personnel dosimetry programme. The proposed plan can be completed within 1992-1997 national plan with the support of IAEA technical assistance, research contract and proper funding from the atomic energy authority of egypt.

11091 (INIS-mf–14469, pp. 61-75) **Potassium body burdens in occupational users of egyptian nuclear research center.** Abdelwahab, M.S.; Youssef, S.K.; Aly, A.M. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference*. Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

A simple calibration procedure for inshas whole body counter for evaluating total potassium have been adopted. More than 120 egyptian employee in the nuclear research center (N. R. C.) were studied for their total body potassium (TBK). The potassium values were found to have an average of 2.85 gm k kg^{-1} body weight for males and 2.62 gm k kg^{-1} for females, which is higher than the recommended value given for reference man by ICRP. The TBK varied directly with body build index and is slightly dependent.7 figs., 1 tab.

11092 (INIS-mf–14469, pp. 78-80) **Research activities related to internal contamination and bioassay and experience gained in this field.** Elsharnouby, M.A.; Shaaban, A.; Atwa, A. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference*. Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

Recent nuclear technology and the wide spread use of radioisotopes mainly in the form of chemical and biological tracers lead to increasing the risk of internal contamination. It is for this reason the assessment of internal contamination and the chemical treatment should be stressed there are two concepts of prime importance-knowledge of the level of risk and knowledge of the urgency of treatment. The pro gent paper deals with these points and the steps taken for administration of first aid to internally contaminated persons.

11093 (INIS-mf–14471, pp. 1-2) **The radiological accident in Goiania A safety culture problem.** Rozental, J.J. (Kibutz Gaash (Israel)). Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

In September 1987, the unauthorized removal of the rotating assembly of the shielding head of a teletherapy unit and the dismantling of the capsule containing 50.9 TBq (1375 Ci) of Cs-137 resulted in a widespread contamination of central Goiania, a Brazilian City, of one million inhabitants, Capita of the State of Goias, 180 km. far from Brasilia, Capital of Brazil. This accident presents lessons which cover the pre-accident period, the emergency phase, and the post-accident phase up to the present. Each of those phases taking into consideration errors, omissions and correct actions by people and organizations must be analyzed in terms of Safety Culture Problems identification because, notwithstanding the recommendations presented in publications concerning emergency planning and preparedness, this radiological accident showed that several adverse vectors, not mentioned in the literature, were a reality. Not only social, political, economic and technical problems had to be faced but also psychological aspects had to be dealt with. Of these the treatment of the victims and handling of the main products of the city were the most important. This deals also with some lessons learned, specially the influence of legislation and rules applied; the interfaces between the State, the Province and the National Nuclear Energy Commission and the different aspects involved in providing information and reports to the government, to the organizations and to the community. (author). 5 refs.

11094 (INIS-mf–14471, pp. 3-6) **Survey of occupational exposure involved in medical and industrial uses of radiation in Israel, 1981-1993.** Biran, T. (Israel Atomic Energy Commission, Yavne (Israel). Soreq Nuclear Research Center); Malchi, S.; Shamai, Y. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The Israeli Dosimetry Center, operated by the Radiation Safety Department at Soreq NRC, serves approximately 10,000 radiation workers throughout the country. Workers in medical, educational and industrial installations are monitored monthly or bi-monthly for external ionizing radiations: X and gamma rays beta radiation, and thermal and fast neutrons. Dosimetry of all but the last category was performed by film until 1979 and by thermo-luminescence-dosimeter badges (chest, head, hand, leg) or TLD rings since then. Fast neutrons were measured by polycarbonate nuclear track etch detector until 1988 and by track etch detector since then. The reporting level was 0.2 mSv /month for gamma- and X-radiation. This document constitutes a summary of the occupational exposures (whole-body only) during the period 1981-1993.A table of numerical information on the number of monitored workers, the annual collective effective dose, and the average annual effective individual dose per monitored worker and per measurable exposed worker

(above the recording level of 0.2 mSv at least once in a year) is presented. The last two columns of the table are the dose distribution ratios. (authors). 2 refs., 2 tabs.

11095 (INIS-mf–14471, pp. 7-13) **Prenatal x-ray exposure, cosmic radiation and unwarranted pregnancy termination.** Kalish, Y. (Beilinson Hospital, Petah Tiqva (Israel). Dept. of Medical Physics); Leser, Y. (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Women who undergo radiographic examination when unknowingly pregnant may thereafter suffer extreme mental anguish in fear that the x-ray induced defects in the baby. At times, these fears may lead some women, even those who want a baby badly, to terminate the pregnancy. In addition, doctors sometimes avoid prescribing dental x-rays , chest x-rays and so forth for pregnant women fearing damage to the fetus. Over the last 40 years, fetal exposure to x-rays has been the subject of numerous studies. Lack of clear information gave rise to unjustified panic among the public in this matter. The aim of this paper is to set the record straight by summarizing the information accumulated to date and by comparing the amount of radiation to which the embryo-fetus is exposed by x-rays with that resulting from cosmic radiation and other natural sources of radiation. (authors). 25 refs.

11096 (INIS-mf–14471, pp. 8-11) **Occupational exposure of diagnostic radiology staff.** Biran, T. (Israel Atomic Energy Commission, Yavne (Israel). Soreq Nuclear Research Center); Malchi, S.; Shamai, Y. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The Israeli Dosimetry Center operated by the Radiation Safety Department at Soreq NRC serves approximately 10,000 radiation workers in Israel. Medical, educational and industrial staff were monitored monthly or bi-monthly during the years 1991-1994. Most of the radiation workers were monitored for whole-body exposure (chest badge) while about 800 workers, especially medical employees, were outfitted in addition with head and/or hand badges. An investigation was initiated whenever one third of the dose limit was exceeded in a single dosimetry period: 1.25 mSv /month for whole-body, 3.75 mSv /month for eyes (head), or 12.5 mSv /month for hands, legs, or skin. During the last couple of years it became obvious that most of the investigations were initiated, almost on a regular basis, for a small group of medical personnel. (authors). 10 refs., 2 tabs.

11097 (INIS-mf–14471, pp. 12-16) **The measuring of the fading of CaF_2:Tm TLDs by computerized glow curve deconvolution and manual analysis.** Ben-Shachar, B. (Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev). Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The fading of CaF_2:Tm during one month was measured in the usual manual method (whole glow curve integration), as well as using computerized glow curve deconvolution. The last method enables us to measure the fading of each peak alone. We received a fading of about 20% for peak 3 and no measurable fading for peak 5 after one month. In the first method we used G-3 cards, as well as TLD-300 chips performing different thermal treatments. The optimal post-irradiation annealing was found to be 110 degree C/10 min and the whole glow curve fading at these conditions was found to be about 5% per month. (author). 7 refs., 1 tab., 1 fig.

11098 (INIS-mf–14471, pp. 26-28) **Thyroid status of children immigrating from the vicinity of Chernobylsk.** Quastel, Mr. (Institute of Nuclear Medicine, Soroka Medical Center, Bewer Sheva (Israel)); Goldsmith, Jr.; Wynberg, J.; Polliak, S.; Levy, Y.; Kordysh, E.; Abrahams, C.; Mirkin, L.; Golan, C. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The area surrounding the Chernobyl plant is generally recognized as a goitreogenous area, in the sense that soils and water are deficient in Iodine, and the incidence of goitre is relatively high. These conditions assure the avid uptake of an iodine as a pollutant, if and when present. The Chernobyl explosion and fire is estimated to have released 1.8*10E18 Bq of Iodine 131 and 3.7*10E18 Bq Iodine 133, together accounting for a large portion of the total radioactive emissions (US Department of Energy z Table 4.3, p. 4.15 in Health and Environmental Consequences of the Chernobyl Nuclear Power Plant Accident DOE/ER-0322, June 1987). Uptake was measured in the thyroid glands of many of those exposed. Within the past three years, the frequency of cancer of the thyroid in children in the Ukraine Belarus and in the Bryansk Region of the Russian Federation has risen rapidly, from less than one case per 100,000 per year in Belarus to over 10 cases in 1991, per 100,000 per year. In respect to the unusual exposures and risks, this report describes what studies we have done among Jewish immigrants from the areas and what our findings seem to mean. (authors). 8 refs., 1 tab., 1 fig.

11099 (INIS-mf–14472) **Environmental radioactivity and radiation exposure in Switzerland 1993.** Bundesamt fuer Gesundheitswesen, Fribourg (Switzerland). Abt. Strahlenschutz. 1994. [290p.] (In German, French, Italian, English). Order Number DE95621257. Source: OSTI; NTIS; INIS.

Systematic monitoring of radioactivity in the environment and food has been going on in Switzerland since the mid 1950s. This report contains a summary of the values measured in 1993, along with the interpretation of the data and the resultant radiation dose for the population. The monitoring programme deals with radioactivity in the atmosphere, precipitation, aquatic systems, grass, foodstuffs and the human body, but also includes natural radiation, doses due to radon inside dwellings, emissions from nuclear power stations and other radiation sources. With two exceptions, the nuclear power plants and other facilities licensed to handle radioactive substances remained within their annual release limits in 1993, and measurements carried out in the environment revealed no inadmissible radioactivity concentrations or dose values. The population's mean annual radiation dose totals 4 mSv. Some 40% of this is due to radon in the home, with a mean of 1.6 mSv and extreme values as high as around 100 mSv; 30% or 1.2 mSv, may be ascribed to natural radiation, leaving less then 0.2 mSv ascribable to man-made sources, excluding medical applications. (author) figs., tabs.

(normal operation). Luetkemeyer, R. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany)). Bundesamt fuer Strahlenschutz, Berlin (Germany); Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). 1992. 292p. (In German). (CONF-9210498–: 2. colloquy on the integrated measuring and information system (IMIS) for monitoring environmental radioactivity - application of the routine measuring program in the five new Federal German States -, Berlin (Germany), 12-14 Oct 1992). In *Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG).* Order Number DE95745952. Source: OSTI; NTIS (US Sales Only); INIS.

The precautionary radiation protection law has considerably improved radiation protection legislation valid so far. The said law, as a complement to the Atomic Energy Act regulating the precautionary protection of the population, has established the foundations for a now uniform system under Federal legislation of continuous environmental radioactivity monitoring. (DG)

Nuclear facilities, nuclear medicine institutions, isotope users and processors, during normal operation continuously release, in a controlled way, small amounts of radioactive materials into the waters together with their liquid wastes. In case of accidental releases from nuclear power plants, from nuclear weapons' tests in the atmosphere as well as in case of uncontrolled nuclear events, the aquatic ecosystems may also be contaminated. In order to record the long-term impacts of such releases and estimate radiation exposure resulting for the relevant exposure pathways, inland waters are monitored by independent measuring points. Representative samples are measured to obtain data which come near to reality. In this connection, the taking of samples is of special importance. Knowledge of the behaviour and residence of radionuclides in waters and of their way of release is required to determine the place and mode of taking samples. (orig./DG)

11102 (INIS-mf–15104) **25th annual meeting of the German Society of Neuroradiology. Abstracts.** Grau, H.C. (ed.). Deutsche Gesellschaft fuer Neuroradiologie e.V., Hamburg (Germany). 1990. 104p. (In German). (CONF-9009554–: 25. annual meeting of Deutsche Gesellschaft fuer Neuroradiologie e.V. (DGNR), Duisburg (Germany), 20-22 Sep 1990). Order Number DE95756337. Source: OSTI; NTIS (US Sales Only); INIS.

The 62 abstracts are precising the individual papers read at the 25th annual meeting of the Germany Society of Neuroradiology, which dealt with the following subjects: The narrowed vertebral canal, congential and acquired spinal compression syndromes (8); neuroradiology of disturbances of perinatal development (7); new horizons in the diagnosis of degenerative and inflammatory disorders of the white matter (14); interventional neuroradiology (12); miscellaneous topics (21). (UHE)

11103 (KFK–5312) **Complementation of radiation-sensitive Ataxia telangiectasia cells after transfection of cDNA expression libraries and cosmid clones from wildtype cells.** Fritz, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Genetik; Karlsruhe Univ. (T.H.) (Germany). Jun 1994. 121p. (In German). Order Number DE95746494. Source: OSTI; NTIS (US Sales Only); INIS.

In this Ph.D.-thesis, phenotypic complementation of AT-cells (AT5BIVA) by transfection of cDNA-expression-libraries was adressed: After stable transfection of cDNA-expression-libraries G418 resistant clones were selected for enhanced radioresistance by a fractionated X-ray selection. One surviving transfectant clone (clone 514) exhibited enhanced radiation resistance in dose-response experiments and further X-ray selections. Cell cycle analysis revealed complementation of untreated and irradiated 514-cells in cell cycle progression. The rate of DNA synthesis, however, is not diminished after irradiation but shows the reverse effect. A transfected cDNA-fragment (AT500-cDNA) was isolated from the genomic DNA of 514-cells and proved to be an unknown DNA sequence. A homologous sequence could be detected in genomic DNA from human cell lines, but not in DNA from other species. The cDNA-sequence could be localized to human chromosome 11. In human cells the cDNA sequence is part of two large mRNAs. 4 different cosmid clones containing high molecular genomic DNA from normal human cells could be isolated from a library, each hybridizing to the AT500-cDNA. After stable transfection into AT-cells, one cosmid-clone was able to confer enhanced radiation resistance both in X-ray selections and dose-response experiments. The results indicate that the cloned cDNA-fragment is based on an unknown gene from human chromosome 11 which partially complements the radiosensitivity and the defective cell cycle progression in AT5BIVA cells. 11104 (KURRI-TR–397) **The records of radiation control division, no.29 (1993).** Iwamoto, Satoshi (ed.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Nov 1994. 35p. (In Japanese). Order Number DE95747918. Source: OSTI; NTIS; INIS.

This report summarizes activities of the Radiation Control Division of KURRI in FY 1993 (from 1 April, 1993 to 31 March, 1994). The Division consists of three Sections: Indoor Radiation Control, Field Radiation Monitoring and Personnel Monitoring Section. Now 18 members including research scientists and technicians are assigned as staffs of the Division, while two persons were reshuffled to the other universities and a new figure was welcomed in this year. The results of activities of the Indoor Radiation Control Section show that levels of external radiation and radioactive contamination within the controlled area have mostly cleared legal criteria, and that management of radioactive isotopes has been dealt with in strict fairness. The Field Radiation Monitoring Section did not detect any unusual level of radiation in the environment. The Personnel Monitoring Section affirms that no one has been exposed with more than 4mSv among 138 staffs and 21 students and researchers. The report also describes tasks exercised by the Office of Health Physics including safety education for staffs and visitors, and liaison with the governmental offices. (author).

11105 (LA-SUB–94-173) **Evaluation of depleted uranium in the environment at Aberdeen Proving Grounds, Maryland and Yuma Proving Grounds, Arizona. Final report.** Kennedy, P.L. (Colorado State Univ., Fort Collins, CO (United States). Dept. of Fishery and Wildlife Biology); Clements, W.H.; Myers, O.B.; Bestgen, H.T.; Jenkins, D.G. Los Alamos National Lab., NM (United States). [1995]. 211p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005102. Source: OSTI; NTIS; INIS; GPO Dep.

This report represents an evaluation of depleted uranium (DU) introduced into the environment at the Aberdeen Proving Grounds (APG), Maryland and Yuma Proving Grounds (YPG) Arizona. This was a cooperative project between the Environmental Sciences and Statistical Analyses Groups at LANL and with the Department of Fishery and Wildlife Biology at Colorado State University. The project represents a unique approach to assessing the environmental impact of DU in two dissimilar ecosystems. Ecological exposure models were created for each ecosystem and sensitivity/uncertainty analyses were conducted to identify exposure pathways which were most influential in the fate and transport of DU in the environment. Research included field sampling, field exposure experiment, and laboratory experiments. The first section addresses DU at the APG site. Chapter topics include bioenergetics-based food web model; field exposure experiments; bioconcentration by

phytoplankton and the toxicity of U to zooplankton; physical processes governing the desorption of uranium from sediment to water; transfer of uranium from sediment to benthic invertebrates; spead of adsorpion by benthic invertebrates; uptake of uranium by fish. The final section of the report addresses DU at the YPG site. Chapters include the following information: Du transport processes and pathway model; field studies of performance of exposure model; uptake and elimination rates for kangaroo rates; chemical toxicity in kangaroo rat kidneys.

11106 (LA-UR–94-3633) **Alpha detection for characterization of D&D sites.** MacArthur, D.W.; Allander, K.S.; Bolton, R.D.; Koster, J.; Rawool-Sullivan, M.; Rojas, S.; Sprouse, L. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941102–33: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95002730. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of radioactive contaminants is required during D&D operations at any facility where radioactivity is suspected or known to exist. Alpha radiation is an excellent indicator of the presence of many isotopes (such as Pu^{239}) which are otherwise difficult to observe. However, traditional fieldable alpha detectors have been hampered by the short range of alpha particles in air and in detector windows. We have developed an alpha detection technology that avoids the problems mentioned above. In a monitor using the long-range alpha detector (LRAD) technology, we detect the ion pairs produced by an alpha particle's interaction with air rather than the particles themselves. In this paper, we discuss several applications to air and soil monitoring as well as potentially contaminated building surfaces and process equipment.

11107 (NIRS-M–90, pp. 22-23) **Induction of chromosome aberrations by randomly directed accelerated charged particles.** Takatsuji, T. (Nagasaki Univ. (Japan)); Okumura, Y.; Takahashi, T.; Yatagai, F.; Nakano, K.; Kanai, T. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9208266–: 2. workshop on physical and biological research with heavy ions, Chiba (Japan), 31 Aug 1992; HIMAC–003). In *Proceedings of the second workshop on physical and biological research with heavy ions.* 56p. Order Number DE95703925. Source: OSTI; NTIS; INIS.

Exchange type chromosome aberration is a main source of radiation cell killing and mutation. Therefore, the mechanism of aberration is a main question in radiation biology. One unknown and important point in this question is whether the aberration arises from the interaction of two radiation damages (interaction model) or from only one radiation damage. The distribution of radiation damages when cells were exposed to randomly directed heavy ions is very different from that when exposed to uniformly directed ions. Materials and the experimental method are described. As the result, rotated samples showed the higher mean frequency of dicentric chromosomes than stationary samples. The method of calculating the mean frequency and the distribution of dicentric chromosomes is explained. As the results of the Monte Carlo simulation, the mean aberration frequency was almost same for all conditions, and the dispersion index presented the larger difference between rotating and stationary conditions along with the increase of intertrack interaction contribution. The stationary condition made the dispersion index larger than the rotating condition for any ratio of interaction contribution. (K.I.).

11108 (NIRS-M–90, pp. 24-26) **Response of the MG-63 human osteosarcoma cell line grown as multicellular spheroids to neutron irradiation.** Kubota, Nobuo (Yokohama City Univ. (Japan). Faculty of Medicine); Kakehi, Masae; Matsubara, Shou; Koike, Sachiko; Ando, Koichi. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9208266–: 2. workshop on physical and biological research with heavy ions, Chiba (Japan), 31 Aug 1992; HIMAC–003). In *Proceedings of the second workshop on physical and biological research with heavy ions.* 56p. Order Number DE95703925. Source: OSTI; NTIS; INIS.

Multicellular tumor spheroids are composed of the mixed populations of cells with regard to cell proliferation, nutrition, oxygenation and radiosensitivity. Human osteogenic sarcoma is generally considered clinically radioresistant. However, the in vitro cell survival curves for human osteogenic sarcoma cell lines do not differ from those of other tumor cell lines. In this study, the responses of human osteogenic sarcoma cell line to gamma ray and neutrons were investigated by using spheroid system. The spheroids of the osteogenic sarcoma cell line are considered to be a good in vitro model of radioresistant tumors. The purpose of this study is to measure the response of the spheroids to fast neutron irradiation. MG-63 human osteogenic sarcoma cell line was used for this study. The cell line was cultured in alpha-MEM with supplement. Cell survival was estimated after the trypsinization of spheroids 24 hours after irradiation. The method of measuring spheroid cure is explained. The mean number of surviving cells per spheroid can be obtained from the mean clonogenic number and cell survival curve. The cell survival of MG-63 spheroids exposed to gamma ray and neutrons and the dose effect curves for spheroid cure after irradiation are shown. (K.I.).

11109 (NIRS-M–98) **Dose assessment and approach to the safety for the public in the emergency. Proceedings.** Nakajima, Toshiyuki (ed.). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. 210p. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). Order Number DE95747912. Source: OSTI; NTIS; INIS.

This issue is the collection of the papers presented at the 21st NIRS seminar on Dose Assessment and Approach to the Safety for the Public in the Emergency. The 16 of the presented papers are indexed individually. (J.P.N.).

11110 (NIRS-M–99, pp. 28-30) **Track structure of heavy ions and inactivation model for microorganisms.** Takahashi, T. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)); Yatagai, F.; Suzuki, M. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

In a recent paper, the analysis of the experimental inactivation cross sections for E. coli mutants was reported. In that case, a radiosensitivity parameter is assumed to be equal to the γ-ray dose for 37% survival of microorganisms. In the theory, the equation for the probability of inactivation and the equation for calculating inactivation cross section are given. But in the analysis, the consistent fit was not able to be attained. In the study by the authors, the better fit was obtained by the assumption of $\pi\alpha^2$ except E. coli K12. In the case of radioresistant microorganisms with high γ dose for 37% survival, it seems necessary to assume that the radiosensitivity parameter is LET dependent, and inactivation cross section is expressed differently. By the above modified theory, the inactivation cross section of B. subtilis spore was successfully explained. A proportional scintillation chamber coupled to an image intensifier-associated CCD camera has been constructed as a promising candidate for the instrument that can measure directly the average dose at a target at the Institute of Physical and Chemical Research, and it is currently under test. (K.I.).

11111 (NIRS-M–99, pp. 31-33) **Microscopical investigation of cellular effects of 135 MeV/amu carbon along the path of the beam.** Furuse, Masako (National Inst. of Radiological Sciences, Chiba (Japan)); Soga, Fuminori; Matsumoto, Shinji. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

The difference in biological effects are normally described by the concept of RBE. However, the RBE values depend on the LET along a trajectory and also on complicated parameters such as the distribution of the energy deposition due to the difference in the spread of secondary electrons perpendicular to a beam axis. The authors are interested in the use of a biological dosimeter of microorganisms which can directly compare biological effects such as survival level. The survival rate of yeast cells was tested for this purpose with a carbon beam at 135 MeV/amu from the RIKEN ring cyclotron. The haploid cells of a wild type and a radiation sensitive mutant were used. Yeast is a simple eukaryote, and it has been used as the test organism especially for the studies on the relation

between DNA double-strand breaks and cell killing. The materials used, the experimental method and the results are reported. The survival data of the wild type and the radiation sensitive mutant at stationary and log phases were obtained, and the values were used for the RBE estimation. The resistance seemed due to the action of enzymatic repair mechanism. (K.I.).

11112 (NIRS-M–99, pp. 38-40) **Response of plateau-phase cultures and multicellular spheroids of human osteosarcoma cells to carbon beam irradiation.** Kubota, Nobuo (Yokohama City Univ. (Japan). Faculty of Medicine); Kakehi, Masae; Matsubara, Sho; Yatagai, Fumio; Kanai, Tatsuaki; Inada, Tetsuo. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

The possible therapeutic advance in achieving local tumor control using high LET radiation therapy is the major area of interest to clinical radiation oncologists and radiobiologists. This includes improved depth dose distribution, greater relative biological effectiveness (RBE) and the greater reduction of oxygen enhancement ratio (OER). In addition, the type of damage produced by charged particles is less amenable to repair. Mammalian cells repair radiation damage by sublethal damage (SLD) repair and potentially lethal damage (PLD) repair. Because the recovery from PLD might significantly contribute to the ultimate therapeutic response of a solid tumor, the ability of plateau phase osteosarcoma cells to recover from PLD after the irradiation with RIKEN ring cyclotron-accelerated carbon ions in the spread-out Bragg peak (SOBP) region was investigated. Also the relation of dose to cure probability for the spheroids of osteosarcoma cells after the irradiation with carbon beam in the SOBP was measured. The materials used, the experimental method and the results are reported. The dose response curves measured and the dose-cure probability relation are given. (K.I.).

11113 (NIRS-M–99, pp. 44-46) **Chromosome aberrations induced by 135 MeV of carbon and neon beams by PRC.** Ohara, Hiroshi (Okayama Univ. (Japan)); Minamihisamatu, Masako; Kanai, Tatsuaki; Eguchi-Kasai, Kiyomi; Itsukaichi, Hiromi; Fukutsu, Kumiko; Yatagai, Fumio; Sato, Kohki. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

Radiation-induced chromosome aberration can be an indicator of the radiation lesions in irradiated cells. Many studies on chromosome aberration induced by X-ray and γ-ray have indicated that the dose response of the aberration can be fitted to a quadratic equation, $Y = \alpha D + \beta D^2$, and it becomes linear as the LET of beams increases. The main subject of this study was some quantification of chromosomal aberration induced by 135 MeV/n carbon and neon beams produced by the RRC, the operation of which increasingly became useful for the studies on heavy ion biology. The results will meet with some of the radiobiological features connected to the specific action of charged particles. The materials used, the experimental method and the results are reported. Four curves of the dose response for the production of dicentric and ring types of aberration induced by carbon and neon beams and four different dose average LETs are given. Aberration production rate became higher as LET increased. Chromosome aberration can be quantified as an indicator of radiation lesions in the case of high LET particle radiation. (K.I.).

11114 (NIRS-M–99, pp. 47-49) **Sensitivity of ts85 mutant strain from mouse FM3A cells to heavy ions.** Yatagai, Fumio (Institute of Physical and Chemical Research, Wako, Saitama (Japan)); Nakano, Kazushiro; Saito, Keiko; Hanaoka, Fumio; Kanai, Tatsuaki. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

One of the interests in elucidating the biological effects of heavy ions is to get some insight into the induced DNA damages in mammalian cells. The cell cycle-dependent change in chromatin structure is generally believed to reflect one of the characteristics of mammalian cells. The ts85 mutant strain from mouse FM3A, defective in ubiquitin-conjugating enzyme E1, represents the defects in the early step of chromatin condensation. The ts mutant cells and their wild type were irradiated with carbon and neon ions to study the contribution of this gene product to the repair of heavy ion damages. The experimental method is explained. The survival curves obtained by the irradiation with carbon and neon ions and X-ray are shown. In contrast to UV irradiation, the survival curves for ts85 mutant irradiated with heavy ions and shifted up to 39degC in the incubation did not represent sensitization as compared to the curves of nonexpressed cells incubated at 33degC following the irradiation. This tendency seems unaffected by the LET factor of heavy particles. The present experimental results suggest that the DNA damages are at least different from UV damages. (K.I.).

11115 (NIRS-M–99, pp. 64-66) **The irradiated volume dependency of early skin reaction after carbon ion beam irradiation.** Tatsuzaki, Hideo (Tsukuba Univ., Ibaraki (Japan). Inst. of Clinical Medicine); Okumura, Toshiyuki; Takahashi, Hideyuki; Miyakawa, Makiko; Kanai, Tatsuaki; Minohara, Shinichi; Sudou, Michio; Yatagai, Fumio. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

The tolerance dose for an organ is dependent on many factors like LET and irradiated volume. The effects of irradiated volume on tolerance doses with different LET beams should be clarified in order to develop better radiation therapy. For this purpose, this experiment was performed by using the skins of mice as the target organ. Twelve weeks old female C_3H/He SiC mice (SPF) were used. All irradiation was performed at the Institute of Physical and Chemical Research using the ring cyclotron. The radiations with different LET used were the entrance plateau portion of the original mono-peak beam of 135 MeV/u carbon ion beam and the 3 cm middle portion spread-out Bragg peak (SOBP) from the same carbon ion beam. The experimental method is explained. Early skin reaction was used as the end point. The irradiated skins were observed every other day from the 7th day after the irradiation to the 35th day. The area-independent skin scores modified from those of Fowler or Aizawa were used because irradiated area was different among three groups. The peak score during observation period was used for the analysis. The peak skin reaction by the irradiation through three kinds of slits is shown. The reaction was saturated above certain dose level. The volume dependence was more eminent in higher dose region. (K.I.).

11116 (NIRS-M–99, pp. 71-73) **Response of mouse intestine after fractionated doses of accelerated carbon-ion with spread-out bragg peak.** Fukutsu, Kumiko (National Inst. of Radiological Sciences, Chiba (Japan)); Kanai, Tatsuaki; Furusawa, Yoshiya. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

For the clinical trial of heavy ion radiation therapy, it is necessary to know the effects of the fractionated dose of accelerated heavy ions on various biological systems. The response of mouse intestines to the fractionated dose of carbon beam was examined. The carbon beam of 135 MeV/u accelerated with the RIKEN ring cyclotron was modulated to have a spread-out Bragg peak of 3 cm width. The flatness of biological effect for the spread-out Bragg peak was investigated. C3H female mice of 16 - 22 weeks age were used. The mice were subjected to the whole body irradiation with unmodulated carbon beam at different depth in spread-out Bragg peak (SOBP). The SOBP was designed for 135 MeV/u carbon beam so that V79 cells were uniformly killed in the peak. The responses to the γ-ray of a ^{137}Cs unit for the reference and the

neutron beam of the NIRS cyclotron were also used. The equal dose of three fractionated exposures was given at 4 h intervals. The number of surviving ileum crypt cells was examined three and a half days after the irradiation. The effects of anesthesia in the γ-ray and neutron irradiations, the surviving crypt stem cells and the biological dose for SOBP are reported. (K.I.).

11117 (NIRS-M–99, pp. 77-79) **Effects of accelerated carbon-ion on the induction of dominant lethality in the teleost fish, Oryzias latipes.** Hyodo-Taguchi, Yasuko (National Inst. of Radiological Sciences, Chiba (Japan)); Kanai, Tatsuaki; Minohara, Shinichi; Furusawa, Yoshiya. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

About a small teleost fish, Oryzias latipes, it has been reported that the dominant lethal mutation test by using the hatchability of eggs is useful for the estimation of the mutagenic effects of radiations and chemicals. In the present experiment, the genetic effects of heavy ions on the male germ cells of the fish by using the dominant lethal test system were studied. One of the albino strain of Medaka was used. The hatchability of fertilized eggs was examined to determine the no irradiation control value. The male of each pair was irradiated with the carbon ions accelerated with the RIKEN ring cyclotron. In the no irradiation control, most embryos hatched 7 - 10 days after fertilization. The numbers of dead embryos and newly hatched fry were counted every day in each cluster. Relative hatchability rate (RHR) was calculated. Dominant lethal rate was calculated as (1-RHR). The number of the irradiated fish pairs and the number of the examined eggs, the fertility of eggs and the hatchability of fertilized eggs due to irradiation, and the dominant lethal rate are reported. The induction of dominant lethality was about two times as high in carbon beam as that by X-ray. (K.I.).

11118 (NIRS-M–99, pp. 80-83) **Apoptosis in thymocytes and lymphoma cells induced by neutrons and X-rays.** Ohyama, Harumi (National Inst. of Radiological Sciences, Chiba (Japan)); Koike, Sachiko; Ando, Kouichi. National Inst. of Radiological Sciences, Chiba (Japan). 1993. (CONF-9309426–: 3. workshop on physical and biological research with heavy ions, Chiba (Japan), 2-3 Sep 1993; HIMAC–006). In *Proceedings of the third workshop on physical and biological research with heavy ions.* 94p. Order Number DE95703924. Source: OSTI; NTIS; INIS.

Apoptosis is a distinctive mode of programmed cell death with characteristic morphological and biochemical features. The cells undergoing apoptosis display shrinkage, chromatin condensation and internucleosomal breakage of DNA. The cell death is a process through which organisms get rid of unwanted cells. Thymocytes are highly radiosensitive, and undergo typical apoptosis within a few hours after the exposure to X-ray. Also extremely radiosensitive thymic lymphoma cells have been found. The effect of 30 MeV NIRS fast neutrons on the induction of apoptosis in thymocytes and thymoma cells was examined in comparison with that of X-ray. Although apoptotic cells increased gradually with time, the apoptotic process proceeded rapidly in individual cells after the onset. By the measurement of cell size distribution, the appearance of a distinct apoptotic cell peak was observed. In the case of neutron irradiation on SCA1 thymic lymphoma cells, the method for counting apoptotic cells based on chromatin condensation was developed. The cell volume reduction of thymocytes, the dose survival curves and the induction of apoptosis in SCA1 are reported. (K.I.).

11119 (NIRS-R–25) **Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.** National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. 93p. (In Japanese). Order Number DE95747891. Source: OSTI; NTIS; INIS.

This publication is the collection of the reports on the project research 'Assessment of Radiation Exposure of the Public to Radioactivities Related to the Environment and Food Chain'. The 16 of the reports are indexed individually. (J.P.N.).

11120 (OEFZS–4714) **An experimental study on mass loading of soil particles on plant surfaces.** Li, J.; Gerzabek, M.H.; Mueck, K. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Mar 1994. 13p. Order Number DE95621193. Source: OSTI; NTIS (US Sales Only); INIS.

Reprint from the journal 'Die Bodenkultur', v. 45(1), p. 15-24, Feb 1994.

Radionuclide contaminated soil adhered to plant surfaces can contribute to human ingestion dose. To determine this contribution, a method of ^{46}Sc neutron activation analysis was established and tested, by which a detection limit of 0.05 mg soil per g dry plant biomass can be obtained. In the field and greenhouse experiment the mass loading of soil on ryegrass (Lolium perenne L.) and broad bean (Vicia faba L.) was investigated and the contribution from rainsplash and wind erosion were evaluated separately. Soil retained on plant surfaces in field conditions in Seibersdorf/Austria was 5.77 ± 1.44 mg soil per g dry plant for ryegrass and 9.51 ± 0.73 mg soil per g dry plant for broad bean. Estimates of contribution from rainsplash and wind erosion to soil contamination of plant during the experimental period are 68 % and 32 % for broadbean, 47 % and 53 % for ryegrass, respectively. Mass loading results from field studies indicate that soil adhesion on plant surfaces can contribute up to 23 % of plant ^{137}Cs contamination, the transfer factors modified by mass loading decline differently, depending on ^{137}Cs concentration of the soil and the soil mass adhered to plant surfaces. (authors).

11121 (OEFZS–4715) **Radionuclide soil-to-plant transfer - experiences from the Chernobyl accident in Austria.** Gerzabek, M.H. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Mar 1994. 12p. Order Number DE95621194. Source: OSTI; NTIS (US Sales Only); INIS.

Posterpresentation on the 15th World Congress of Soil Sciences, 10-16 Jul 1994, Acapulco (MX).

In field studies after the Chernobyl fallout in Austria distinct differences in soil-to-plant transfer of ^{137}Cs and ^{90}Sr between crops were observed. However, within single plant species transfer values varied over one to three orders of magnitude. The main influencing factors are the soil properties, the soil adhesion phenomenon and probably the unhomogeneous vertical distribution of the radionuclides after plowing. On the basis of the presented results we should be aware of the uncertainties of the simple soil-to-plant transfer model, which partly mask the influence of soil parameters on root uptake and translocation. (author).

11122 (OEFZS–4717) **Aircrew radiation exposure: sources-risks-measurement.** Duftschmid, K.E. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). May 1994. 15p. Order Number DE95621162. Source: OSTI; NTIS (US Sales Only); INIS.

Paper presented at the Radiation Symposium of the 'International Federation of Air Line Pilots Associations (IFALPA)', 9 May 1994.

A short review is given on the actual aircrew exposure and its sources. The resulting risks for harmful effects to the health and discuss methods for in-flight measurements of exposure is evaluated. An idea for a fairly simple and economic approach to a practical, airborne active dosimeter for the assessment of individual crew exposure is presented. The exposure of civil aircrew to cosmic radiation, should not be considered a tremendous risk to the health, there is no reason for panic. However, being significantly higher than the average exposure to radiation workers, it can certainly not be neglected. As recommended by ICRP, aircrew exposure has to be considered occupational radiation exposure and aircrews are certainly entitled to the same degree of protection, as other ground-based radiation workers have obtained by law, since long time. (author).

11123 (ORNL–6846) **Level III baseline risk evaluation for Building 3505 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Mostella, W.B. Jr. Oak Ridge National Lab., TN (United States). Dec 1994. 256p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004996. Source: OSTI; NTIS; INIS; GPO Dep.

The Level III Baseline Risk Evaluation (BRE) for Building 3505, the ORNL Metal Recovery Facility, provides an analysis of the potential for adverse health effects, current or future, associated with

the presence of hazardous substances in the building. The Metal Recovery Facility was used from 1952 through 1960 to process large quantities of radioactive material using the PUREX process for the recovery of uranium-238, plutonium-239, neptunium-237, and americium-241. The facility consists of seven process cells (A through G), a canal, a dissolver room, a dissolver pit, an office, locker room, storage area, control room, electrical gallery, shop, and makeup area. The cells were used to house the nuclear fuel reprocessing equipment, and the canal was constructed to be used as a water-shielded transfer canal. Currently, there are no known releases of radioactive contaminants from Building 3505. To perform the BRE, historical radiological survey data were used to estimate the concentration of alpha- and beta/gamma emitting radionuclides in the various cells, rooms, and other areas in Building 3505. Data from smear surveys were used to estimate the amount of transferable contamination (to which receptors can be exposed via inhalation and ingestion), and data from probe surveys were used to estimate the amount of both fixed and transferable contamination (from which receptors can receive external exposure). Two land use scenarios, current and future, and their subsequent exposure scenarios were explored in the BRE. Under the current land use scenario, two exposure scenarios were evaluated. The first was a worst-case industrial exposure scenario in which the receptor is a maintenance worker who works 8 hours/day, 350 days/year in the building for 25 years. In the second, more realistic exposure scenario, the receptor is a surveillance and maintenance (S&M) worker who spends two 8-hour days/year in the building for 25 years.

11124 (ORNL/TM–12817, pp. 3-14) **Personal monitoring in the United Kingdom.** Marshall, T.O. (National Radiological Protection Board, Chilton (United Kingdom)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is intended to provide some insight into the status of personal monitoring in the United Kingdom for external radiation. Personal dosimetry services for classified workers must operate the legislative framework of the Ionising Radiations Regulations, stemming from the Directive of the Council of the European Economic Community. The Regulations are, in the main, the work of the Health and Safety Executive (HSE) who also approve dosimetry services for the monitoring of classified workers. The basis of approval and performance tests dosimetry services are obliged to pass are discussed. There is a relatively larger number of services in operation in the UK: an indication of the number and their size is given. Until recently, these services measured a variety of radiation quantities but from 1st January 1994 they were required to measure the ICRU operational quantity Personal Dose Equivalent at depths of 10 and 0.07 mm. The design and performance of dosemeters used in the UK to measure these quantities for neutrons and photons are discussed paying particular attention to progress made on the introduction of an approved served based on an electronic dosemeter.

11125 (ORNL/TM–12817, pp. 15-20) **Status of radioprotection at Brazilian Universities.** Caballero, K.C.S. (EE/COPPE, Rio de Janeiro (Brazil)); Borges, J.C. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Since the Brazilian Nuclear Energy Commission - CNEN - didn't know the whole reality of radiation control at academic institutions, we decided, in 1991, to undertake a research effort in order to elucidate how such activities were indeed conducted. A questionnaire covering technical, administrative and legal subjects, was sent to 91 institutions (36% answered back), propiating substantial data, that showed an equilibrium among institutions which have and have not radioprotection plans/services/supervisors. Based on the tree analysis technique proposed by AIEA, a Reference Radioprotection Program was elaborated to help people envolved with ionizing radiations to improve safety of their activities and workrooms.

11126 (ORNL/TM–12817, pp. 21) **Assessment of radiation doses at the Instituto de Pesquisas Energeticas e Nucleares.** Sanches, M.P. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Sahyun, A.; Sordi, G.M.A.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

External monitoring for air dose measurement using thermoluminescence CaSO(sub 4):Dy dosimeters put in fixed points was done inside the IPEN-CNEN/SP area. This measure was done with the objective to understand the influence of nuclear and radioactive facilities inside the IPEN-CNEN/SP workplaces into the environment. The adopted method involves the use of TLD's, which measure dose rather than dose rate. This study was carried out to evaluate the radiation level for electromagnetic radiation in different places at IPEN-CNEN/SP. The observed results at the previously established points was up to 15 times the background level. From the results of this evaluation we could get a gross estimation of plant influence and specific influence of some types of sources. This analysis opens a window to make more accurate studies to evaluate the contribution of each installation to background dose variation and what is its contribution to collective dose of IPEN-CNEN/SP population, inside the facilities, as well as in those people who suffer contributions from each facility.

11127 (ORNL/TM–12817, pp. 25-36) **The Central Index of Dose Information: dose distributions in the United Kingdom over the period 1986-1991.** Williams, M.K. (Health and Safety Executive, London (United Kingdom)); Iles, W.J.; Marshall, T.O. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Central Index of Dose Information (CIDI) is the Health and Safety Executive's (HSE) national database of occupational exposure to radiation. It is operated for the regulatory authority on an agency basis by the National Radiological Protection Board (NRPB). This paper describes the functions and methods of operation of CIDI, the types and method of data transfer between CIDI and the approved dosimetry services are the summarized annual data to be published relating to the CIDI. One of the functions of CIDI is to provide statistics to guide policy making on a national basis. To facilitate this, dose information for individuals on CIDI is associated with particular occupational categories. Last October HSE published an analysis of the dose information received by CIDI for the years 1986-1991. This analysis revealed a number of important facts and trends which will be discussed. For all classified persons, for example, the mean doses are low, ie., 1.5 mSv in 1991 about 50% of the 1986 figure. There was a sustained downward trend in both mean and collective dose over the whole period, the reduction in collective dose over the period was more than 50%. There was a dramatic reduction (more than 10-fold) over the 6 year period in the proportions of classified persons who had a reported annual dose in excess of 15 mSv (the principal investigation level). 147 persons were reported as having received more than 15 mSv in 1991 compared with more than 1900 classified persons for 1986. Data on a number of a work categories will be presented.

11128 (ORNL/TM–12817, pp. 37) **Cancer mortality experience in the workers of the French nuclear industry: Some questions of dose reconstruction from an epidemiological perspective.** Bard, D. (Institut de Protection et de Surete Nucleaire, Fontenay-aux-Roses (France)); Hubert, Ph.; Dagorn, H. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The International Agency for Research on Cancer has initiated an International Study on Cancer Risk among Radiation Workers in the Nuclear Industry, in which our group participates with respect to the French Atomic Commission (CEA) workforce. The aim of this epidemiological study is to examine cancer risk in subjects with protracted exposure to lowdose ionizing radiation. In this regard, associating a study subject with a reliable, accurate and precise cumulative dosimetry estimate is of paramount importance. However, estimates of historical exposures have been influenced by variations in populations surveyed,in frequency of devices, readings and registration practices. Also, the types of monitoring devices and their lower limits of detection. This paper presents these changes within the various plants or installations of the CEA, from 1950 to 1990. The implications for epidemiological endpoints analyses are discussed.

11129 (ORNL/TM–12817, pp. 39) **General approach and preliminary results on gamma - field reconstruction for the Techa River.** Burmistrov, D.; Valchuk, V. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

From 1949 to 1956 radioactive wastes of nuclear plant 'Mayak' were being dumped into the Techa river. About 28,000 people were exposed to elevated doses. A vast amount of long-term observation data for the exposed population was accumulated, yet the dose estimations used now are not adequately substantiated for risk assessment and do not take into account of all the measurements that were made in the '50s. The necessary part of the project is to reconstruct the gamma-fields at the banks of the river over the period of massive releases. The suggested approach to the problem consists of elaboration on mathematical models for the available measurements, including the goal function, which represents the proximity of the model predictions to the whole set of measurements, and determination of the best fit parameters of the models by minimization of the goal function. To simulate radionuclide transport a compartment model is applied. There are two types of compartments concluded in the model, describing the river itself, and ponds, bogs or floods. The number of compartments is about 30. The river itself is divided into 7 zones with different hydrology characteristics. The compartment interactions are described in terms of volumetric flow rate and the effective diffusion rate. the model is in good agreement with the measurements.

11130 (ORNL/TM–12817, pp. 41) **The National Dose Registration and Information System: Dose distributions in the Netherlands over the period 1989-1993.** Dijk, J.W.E. van (TNO Radiological Service, Arnhem (Netherlands)); Julius, H.W.; Bogaerde, M.A. van de. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In 1988 the Ministry of Social Affairs and Employment commissioned TNO Radiological Service to set up a National Dose REgistration and Information System (NDRIS). The government had three reasons in view to build NDRIS: To improve radiation protection by supervising the occupational doses of radiation workers by using one central database system; To improve the reliability of long term storage of dose data; To improve the possibilities for statistical analysis of occupational doses to guide policy making. Each approved dosimetry service (ADS) in the country sends its dose information to NDRIS on a monthly basis. IN its turn NDRIS sends back for each worker monitored by that ADS, the integrated dose as measured by any ADS. This creates the possibility for each ADS to report to the workers their total annual dose irrespectively whether they work for more than one employer or are monitored by more than one ADS, either simultaneously or successively in the course of the year. European legislation requires that the occupational dose should be controlled in this way. The availability of the centralized database replaces the need of a radiation passbook for national use. The passbook that is needed by radiation workers during interstate travelling can be produced using data from NDRIS.

11131 (ORNL/TM–12817, pp. 43-48) **Radiological safety assessment of gas mantle industries in India.** Sadagopan, G. (Bhabha Atomic Research Centre, Trombay (India)); Venkataraman, G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Thorium, a radioactive element of actinide family was discovered by Berzelius in 1828 and named by him in honor of the Scandinavian God 'Thor'. Following its discovery the earliest known use of thorium was in the making of gas mantles. The other use as an X-ray contrast medium 'Thorotrast' has since long been discontinued, where as even today its use in gas mantles is continued. Gas lights have been used as a source of light since 1800's. In India, although electric bulbs have replaced most of the gas lights, even today in villages and in urban areas where there is no continuous power supply and in outdoor lightings gas lamps are used. The mantle which is used in these lamps is called the Welsbach mantle and is a netted hose that is impregnated with thorium nitrate and other metals. The function of a gas mantle is to produce a bright light during operation of the lighting device (gas or kerosene lamp) in which the mantle is placed. When placed in a lighting device and heated to 1300-1800 degree Celcius thorium in the mantle incandesces and gives off bright light. In India presently there are about 70 manufacturing units handling 150 metric tons of thorium nitrate annually. There are about four hundred persons involved in manufacturing 200 million mantles per year. Thorium is chosen because of its property of incadescence, however since it is radioactive, radiation safety of the workplace, handling personnel and safe environmental condition for members of public have to be maintained.

11132 (ORNL/TM–12817, pp. 49-58) **Monte Carlo technique applications in the field of radiation dosimetry at the ENEA Radiation Protection Institute: A review.** Gualdrini, G.F. (ENEA-AMB, Bologna (Italy)); Morelli, B.; Casalini, L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

At the ENEA (Ente Nazionale per le Nuove Technologie l'Energia e l'Ambiente) Institute of Bologna (Italy) many years of various activities have been carried out in the field of experimental dosimetry and radiation protection. As far as the external radiation monitoring is concerned, these activities dealt with the design, development and type test of photon personal dosemeters as well as routine reading and control of dosemeters, calibration activities etc. As far as the internal dosimetry activities are concerned a whole body counter (WBC) has been built and used many years both for research activities and for routine assessment of internal doses. The WBC has been extensively used in the recent years, especially after the Chernobyl accident, to assess doses from intake of radioactive nuclides for Italian workers employed in Russia as well as normal population mainly living in the north-eastern Italian areas. In recent years, the necessity of improving the general dose assessment capabilities and to provide accurate field parameters and operational quantities, according to the international recommendations, outlined the importance of coupling experimental work with Monte Carlo radiation transport modelling. The present paper summarizes some studies carried out with Monte Carlo in the framework of the ENEA contribution to the activities of the EURADOS Working Group 4; they are concerned with computations of field parameters and operational quantities for the ICRU sphere with reference photon beams and modelling and calculations for photon internal and external dose assessment with the ADAM anthropomorphic phantom.

11133 (ORNL/TM–12817, pp. 59) **The implementation of new radiation quantities in nuclear power plants in Taiwan.** Tung, C.J.; Niu, H.; Chen, T.J.; Chou, T.L.; Yeh, W.W.; Liao, R.Y.

Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The International Commission on Radiological Protection (ICRP) and the International Commission on Radiation Units and MEasurements (ICRU) recommended basic and operational dosimetric quantities for external radiation protection. These quantities include the equivalent dose to an organ or tissue, the effective dose, the ambient dose equivalent, the directional dose equivalent, the individual dose equivalent-penetrating, and the individual dose equivalent-superficial. In the general principals of monitoring for radiation protection of workers, ICRP recommended: At low dose equivalents dosimetric quantities might be used directly to assess exposure, since accuracy is not crucial. At intermediate dose equivalents somewhat greater accuracy is warranted, and the conversion coefficients from dosimetric to radiation protection quantities should be applied. For significant exposures that are deemed abnormal, actual absorbed doses in the body, from an assessment of the accident, should be used. In order to determine radiation protection quantities and actual absorbed doses in the body, we surveyed high radiation areas in all three nuclear power plants in Taiwan. Applying these results, the body doses may be more accurately evaluated for workers exposed to high-level radiation.

11134 (ORNL/TM–12817, pp. 61) **Occupational radiation exposures to railroad workers from shipments of radioactive materials.** Fields, D.E. (Oak Ridge National Lab., TN (United States)); Cottrell, W.D. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Fissile and high-level radioactive wastes are currently transported over long distances by truck and by rail transportation systems. The primary form of fissile material is spent reactor fuel. DOE projected increases in the rate of shipments have generated concern by railroad companies that railroad workers may be exposed to levels of radiation sufficiently high that a radiation protection program may need to be implemented. We have estimated doses to railroad workers for two exposure scenarios that were constructed using worker activity data obtained from CSX Transportation for crew and maintenance workers. This characterization of railroad worker activity patterns includes a quantitative evaluation of the duration and rate of exposure. These duration and exposure rate values were evaluated using each of three exposure rate vs. distance models to generate exposure estimates.

11135 (ORNL/TM–12817, pp. 63-71) **Field experience with remote monitoring.** Desrosiers, A.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Remote Monitoring System (RMS) is a combination of Merlin Gerin detection hardware, digital data communications hardware, and computer software from Bartlett Services, Inc. (BSI) that can improve the conduct of reactor plant operations in several areas. Using the RMS can reduce radiation exposure to radiation protection technicians (RPTs), reduce radiation exposures to plant maintenance and operations personnel, and reduce the time required to complete maintenance and inspections during outages. The number of temporary RPTs required during refueling outages can also be reduced. Data from use of the RMS at a two power plants are presented to illustrate these points.

11136 (ORNL/TM–12817, pp. 73) **Implementation of a self-directed work team in a TLD Processing Center.** Arnwine, A.A. (Martin-Marietta Energy Systems, Oak Ridge, TN (United States)); Bogard, R.S.; Teasley, N.A.; Somers, D.E.; Souleyrette, M.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In an effort to maintain productivity with a decreasing work force, the Oak Ridge Y-12 Plant has adopted the concept of Self-Directed Work Teams in various disciplines. The plant's Health Physics Department was able to eliminate a layer of front-line supervisors by establishing four self-directed work teams. Each team was able to choose their method of implementation. The TLD Processing Center Team chose to use project managment tools to ensure a smooth transition from the traditional work group to a self-directed approach. This process focused on establishing responsibilities, determining training requirements, determining a leadership style for the group, and performing a potential problem analysis for the transition. The transition also reviewed interface issues that could occur with upper management, matrix management, technical oversight, and organizational peers. The team's experience is also evaluated in comparison to other Self-Directed Work Teams.

11137 (ORNL/TM–12817, pp. 75) **Experience with REIRS for the revised 10 CFR 20.** Hagemeyer, D.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Regulatory Commission's (NRC's) Radiation Exposure Information Recordkeeping System (REIRS) was resently updated to accomodate the changes required by the revised 10 CFR 20. A brief history of the REIRS database will be presented, along with a summary of implemented changes. The status of REIRS will be discussed including the current process for submitting data, correcting previous data, and requesting dose history reports. Additionally, this paper will summarize the NRC sponsored Radiation Exposure Monitoring and Information Transmittal (REMIT) computer program, which is a PC-based, menu driven tool that facilitates the manipulation of occupational radiation exposure data, computes internal doses from intake estimates, and produces hardcopy NRC forms. The status of the DOE Radiation Exposure Module (REM) system will also be discussed, including plans to upgrade it to be more consistent with the NRC REIRS.

11138 (ORNL/TM–12817, pp. 77) **A few experiences and lessons learned in installing radiological access control systems.** Benson, R.G.; Clemmons, A.; Clemmons, P. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Unforeseen obstacles are often encountered during the installation of any information system. Radiological access control systems add unique complications. Many costly events can be averted if appropriate action takes place prior to installation and system startup. Based upon experiences gained from installing systems into radiological environments since 1980, several key areas are addressed with recommendations in how to avoid these pitfalls. These areas include hardware considerations, working with vendors and customers, implementation schedule pitfalls, system design considerations for successful startup, user and system training (especially dosimetry), the value of factory acceptance testing, and the importance of user support at the site. Actual examples from installations at several nuclear facilities will be presented.

11139 (ORNL/TM–12817, pp. 79) **System integration for radiation records.** Lawson, B.J. (Knolls Atomic Power Lab., Inc., Schenectady, NY (United States)); Farrell, L.; Meacham, C.; Tapio, J. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

System integration is the process where through networking and/or software development, necessary business information is available in a common computing environment. System integration is becoming an important objective for many businesses. System integration can improve productivity and efficiency, reduce redundant stored information and errors, and improve availability of information. This paper will discuss the information flow in a radiation health environment, and how system integration can help. Information handled includes external dosimetry and internal dosimetry. The paper will focus on an ORACLE based system integration software product.

11140 (ORNL/TM–12817, pp. 83) **A new combination beta/gamma/neutron whole-body dosimeter.** Hoffman, J.M. (Los Alamos National Lab., NM (United States)); Mallett, M.W.; Hsu, H.H.; Buhl, T.E.; Vasilik, D.G.; Tawil, R.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A new combination beta/gamma/neutron TLD and track-etch whole-body dosimeter and associated dose algorithm is described. This whole-body dosimeter consists of two Harshaw/Bicron TLD cards and two NE Technology PN-3 track-etch detectors. One card is designed to perform beta and gamma dose determinations. The beta/gamma TLD card consists of two thin (6 mil) high sensitivity LiF TLD chips, one 15 mil LiF chip, and one 15 mil CaF chip, with all four chips mounted bare on Kapton. The 15 mil LiF and CaF chips are covered with ABS plastic filters and provide for a measure of the photon energy incident on the disometer and allow for calculation of the photon dose at the three depths of interest. The remaining card is used for neutron dosimetry. The design results in a smooth exponential function which starts flat at very moderated neutron energies and rises steeply near bare fission spectral energies. The track-etch detectors are utilized based on two criteria: the new neutron signal on the albedo detector is above a given threshold and, the albedo/anti-albedo ratio indicated neutron exposure above a given energy.

11141 (ORNL/TM–12817, pp. 85) **Design, modeling, and improvements to the Los Alamos National Laboratory TLD based neutron dosimeter.** Casson, W.H. (Los Alamos National Lab., NM (United States)); Buhl, T.E.; Devine, R.T.; Hoffman, J.M.; Hsu, H.H.; Mallett, M.W.; Vasilik, D.G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The response of a TLD based neutron dosimeter has been modeled in detail using a Monte Carlo code to predict the energy response. Detailed measurements have been made of the response of a track etch component. The results of the two efforts have been combined into an improved dosimeter unit with dose equivalent response from thermal up to approximately 20MeV. The response above 20MeV has been estimated. The response has been calculated for various isotopic neutron sources as well as typical work area spectra around glove boxes and hot cells. The new dosimeter design, which does not require a premeasured neutron correction factor for each neutron field measured, will replace a single TLD-600 chip system currently in use.

11142 (ORNL/TM–12817, pp. 87) **TLD system ENDOVA-20 for individual monitoring according to the ICRU recommendations.** Loez, J. (ENDOS GmbH, Teltow (Germany)); Holzapfol, G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; iNIS; GPO Dep.

Following the current trends in personal dosimetry, a TLD system, ENDOVA-20, has recently been constructed at ENDOS, the performance of which, as well as the results of the type testing measurements at the Physikalisch-Technische Bundesanstalt are going to be presented.

11143 (ORNL/TM–12817, pp. 89) **A comparison of hypersensitive TL materials in card configurations.** Velbeck, K.J. (Harshaw/Bicron Radiation Measurement Products, Solon, OH (United States)); Tan, Y.; Tawil, R.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

There has been great interest expressed in hypersensitive thermoluminescent (TL) phosphors and particularly the newly developed LiF:Mg,Cu,P. These materials exhibit sensitivities one to two orders of magnitude greater than the most commonly used phosphor, LiF:Mg,Ti (TLD-100). This greater sensitivity results in improved signal-to-noise ratios and consequently lower detection thresholds, making the material ideal for low-dose applications such as environmental monitoring. A series of tests has been conducted to characterize the performance of these materials in card format using a Harshaw Model 8800 Automatic TLD Card Reader. Because of temperature sensitivities above 240 degrees C, special precautions must be taken when mounting the material into a card in order to preserve the material trap structure and sensitivity. Accordingly, a process has been implemented whereby the various phosphors are affixed to a polyimide film, then mounted into cards. This paper describes the method used and presents the results from the tests. These test provided data on minimum detectibility, reproducibility, residual effects, sensitivity to ambient light, and linearity. A comparison of the various materials' sensitivity to ionizing radiation is also presented.

11144 (ORNL/TM–12817, pp. 91) **Using the high temperature thermoluminescence peak of ZrO_2 for the precision dosimetry of UV radiation.** Su, Ching-shen (National Tsing Hua Univ., Hsinchu (Taiwan, Province of China)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The thermoluminescence (TL) peak of ZrO_2 at high temperature was found stable with good linear response to exposure to ultraviolet (UV) radiation. If the UV radiation measurement is made to read the TL peak of an irradiated detector at a pre-determined temperature rather than to scan in a temperature range with certain rates of temperature increment, then the error resulting from the TL scan can be eliminated and precision radiation dosage can be measured. This method depends on the thickness of detector, also the precision temperature of the reader, these can all be made easily within required accuracies. The use of ZrO_2 as a detector for UV radiation measurement via the 210 degree C TL peak was proposed. The linearity of the UV radiation response was shown to be better than those at the 90 and 135 degree C TL peaks for the ZrO_2 sintered at 1,100 degrees C. Better sensitivity was also obtained when the ZrO_2 was doped with impurity Er_2O_3 of 1 mole %.

11145 (ORNL/TM–12817, pp. 93) **Ultraviolet and laser radiation dosimetry using photostimulated thermoluminescence in $CaSO_4$:Dy.** Potiens, A.J. Jr. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Campos, L.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Photostimulated thermoluminescence (PSTL) is a technique that was developed through the study of light effects in thermoluminescent materials. Applications include high dose dosimetry, dose reevaluation, ultraviolet (UV) and laser radiation dosimetry. The objective of this work is to study the PSTL in CaSO(sub 4):Dy in several UV wavelengths of interest and laser radiation. The CaSO(sub 4):Dy is an extremely sensitive thermoluminescent material that has a dosimetric peak at 220 degree C and is successfully used in gamma radiation dosimetry. The CaSO(sub 4):Dy

produced at IPEN was used in teflon pellet form which were annealed at 300 degrees C for 15 minutes before the irradiations and exposure to UV light. The PSTL response linearity with exposure time for light wavelength was verified. The obtained results show that CaSO(sub 4):Dy teflon pellets presents a good performance to PSTL to be used in UV and laser dosimetry.

11146 (ORNL/TM–12817, pp. 95-100) **A precision broad-range dosimeter based on cerium doped yttrium aluminum perovskite (YAP).** Fyodorov, A.A. (Virginia Tech, Blacksburg, VA (United States)); Mattson, M.E.; Trower, W.P.; Zuevsky, R.F. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Among the properties of YAP relevant for dosimetry are its rapid (~28 ns) dominant (97%) bright (~40% of NaI:Tl) decay with neligible afterglow as well as its physical ruggedness and chemical nonreactivity. Our recent success with YAP-based x-ray, γ-ray, and alpha particle detectors encouraged us to use a YAP scintillator in a broad range (20-3,000 keV) portable dosimeter. Its large Compton-to-photoabsorption cross section ration makes YAP response relatively energy insensitive and so it becomes a promising phosphor for accurately measuring exposure, equivalent, and absorbed doses. Its stopping power and speed allow a YAP-based dosimeter to operate over more than five decades of exposure dose (5 μR/h to 1 R/h) using only a single small (25 mm diameter, 15 mm thick) crystal. In a radiation field of (~10 μR/h) (~20 counts/s) a statistical precession of ~15% can be obtained in ~10 s. In implementing our broad-range YAP-based dosimeter we have used spectrometric signal processing and a measured absorbed energy data correction algorithm which provides the possibility of reducing the measured dose energy dependence to ±10% over the full energy range. We have verified our instrument using usual γ-ray sources. To extend the dosimeter range down to ~5 keV we are constructing a combination YAP-plastic scintillator.

11147 (ORNL/TM–12817, pp. 101-108) **An yttrium aluminum perovskite based gamma-ray dosimeter.** Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The technical objectives of this work are to construct and evaluate the dosimetric potential of YAP-plastic combination detectors with both photomultiplier tube and photodiode readout; and to design a dosimetric detector array optimized for sensitivity and energy independence using Monte Carlo computer simulations. This report describes the progress towards achieving these goals during the first two months.

11148 (ORNL/TM–12817, pp. 109-115) **Optimization of a new TLD annealing procedure.** Michel, R. (Pacific Northwest Lab., Richland, WA (United States)); Eichner, F.N.; McDonald, J.C.; Papin, P.J. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The response and sensitivity of LiF thermoluminescent materials exposed to high levels of gamma radiation was studied for different annealing procedures in which the presence of nitrogen or air was controlled. After studying different time, temperature, and atmosphere profiles, an annealing procedure consisting of heating TLDs for 2 hours in a N_2 atmosphere over at 400°C, identified as the most cost-effective process tested. Moreover, this procedure still provided very good results, recovering the original sensitivity, and obtaining reproducible glow curves of TLDs exposed to high levels of ionizing radiation.

11149 (ORNL/TM–12817, pp. 119-125) **Estimates of bias and uncertainty in recordered external dose.** Fix, J.J. (Pacific Northwest Lab., Richland, WA (United States)); Gilbert, E.S.; Baumgartner, W.V. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A study is underway to develop an approach to quantify bias and uncertainty in recorded dose estimates for workers at the Hanford Site based on personnel dosimeter results. This paper focuses on selected experimental studies conducted to better define response characteristics of Hanford dosimeters. The study is more extensive than the experimental studies presented in this paper and includes detailed consideration and evaluation of other sources of bias and uncertainty. Hanford worker dose estimates are used in epidemiologic studies of nuclear workers. A major objective of these studies is to provide a direct assessment of the carcinogenic risk of exposure to ionizing radiation at low doses and dose rates. Considerations of bias and uncertainty in the recorder dose estimates are important in the conduct of this work.

11150 (ORNL/TM–12817, pp. 127-133) **Exposure reductions encouraged by the determination of the effective dose equivalent for non-uniform external exposures.** Matheny, M.D.; Brown, C.G.; Dyer, S.G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Savannah River Company has developed a simple dose calculation scheme based on a craft report by the External Dosimetry Working Group of the Health Physics Society Standards Committee. The calculations involved are fairly simple and provide a conservative dose estimate. The resulting external dose equivalent (EDE) estimate provides a much better representation of the risk to the monitored individual than the more prevalent practice of assigning the highest measured dose. Details of the dose assessment methodology are included as an attachment. Although there is some additional effort required on the part of the dosimetrist to determine the EDE. The reduced risk for employees, the more accurate record of dose, and the reduced cost for the company are compelling arguments for the use of the concept. The technique described in the attachment provides a simple approach that is easily defended and implemented.

11151 (ORNL/TM–12817, pp. 135) **Development of new methodology for dose calculation in photographic dosimetry.** Daltro, T.F.L. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Campos, L.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A new methodology for equivalent dose calculation has been developed at IPEN-CNEN/SP to be applied at the Photographic Dosimetry Laboratory using artificial intelligence techniques by means of neural network. The research was oriented towards the optimization of the whole set of parameters involved in the film processing going from the irradiation in order to obtain the calibration curve up to the optical density readings. The learning of the neural network was performed by taking readings of optical density from calibration curve as input and the effective energy and equivalent dose as output. The obtained results in the intercomparison show an excellent agreement with the actual values of dose and energy given by the National Metrology Laboratory of Ionizing Radiation.

11152 (ORNL/TM–12817, pp. 137) **Energy dependence of pen dosemeters for x-rays (20-60 kV).** Oliveira, E.C. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Xavier, M.; Caldas, L.V.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings,*

program, and abstracts. 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Pen dosemeters are especially important for individual radiation monitoring because they allow direct and rapid exposure measurements. Three kinds of pen dosemeters (A, B, C) were tested in low energy X radiation fields of the Calibration Laboratory of Sao Paulo, in order to verify their energy dependence. The dosemeters of type A and C presented the highest radiation sensitivity of the investigated energy range. Short-term stability tests were performed and the results depend on the dosemeter type and the energy: the highest and lowest variations were obtained respectively for the type C pens and type B pens. All dosemeters presented high energy dependence, varying for type B pens between 98% and 64%. In the case of the backscattering response contribution study with the phantom, the type C pens showed the largest values. These high values are probably due the their strong radiation sensitivity. The obtained results showed consistency with literature data. All tested pen types must be used very carefully for X radiation detection in the investigated low energy range using convenient correction factors.

11153 (ORNL/TM–12817, pp. 141-150) **New phosphate glass dosemeter systems for routine individual and environmental monitoring.** Burgkhardt, B. (Karlsruhe Nuclear Research Centre (Germany)); Piesch, E.; Ugi, S.; Ishikawa, T.; Ikegami, T.; Omori, T. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Two recently developed photoluminescent dosemeter (PLD) systems are now commercially available which similar to conventional TLD systems allow a fully automatic readout and data evaluation: (a) The one-element dosemeter SC-1 makes use of a perforated tin filter for the simultaneous measurement of the exposure X and $H_p(10)$ in the photon energy range 25 keV and 12 keV to 1.3 MeV, respectively, allowing in addition an automatic scanning of the glass, horizontally and vertically, for estimating radiation quality and direction of radiation incidence. The system is pattern approved by the PTB and applied by two German dosimetry services. (b) The four-element dosemeter GD-400 uses metal and plastic filters of different thicknesses. The linear combination of the detector readings allows the energy independent measurement of exposure X or $H_p(10)$ for photons and $H_p(0.07)$ for beta rays and photons. The pulsed UV laser excitation permits a suppression of the intrinsic pre-dose reading and for annealed glasses the coefficient of variation is 10% at 30 μSv. Routine results are presented for PLD and electronic personal dosemeters worn simultaneously in controlled areas of nuclear power stations. With respect to long-term environmental monitoring PLD and TLD systems are compared in the temperature dependent fading characteristics, the self-irradiation and the response to cosmic rays.

11154 (ORNL/TM–12817, pp. 151) **Personal monitoring at accelerators using CR-39.** Greenhouse, N.A. (Lawrence Berkeley Lab., CA (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Applications of CR-39 for neutron dosimetry have been dominated by situations where neutron energies fall within the fission spectrum range. We have studied the response of this material to roughly mono-energetic neutrons of 20 to 65 MeV. Although the sensitivity of the material is reduced by a factor of about five when compared with the response plateau at 3MeV, the high-energy response does appear to be useful for personal monitoring at accelerators. This paper presents work done at U.C. Davis as well as that at the 88-Inch Cyclotron, LBL. The utility of this detector for personal monitoring at facilities of similar energy was confirmed. The tentative conclusion of this work is that CR-39 is an acceptable personal monitoring device for use at accelerators of equivalent energy. Therefore it can replace Kodak's NTA film for this purpose.

11155 (ORNL/TM–12817, pp. 153-161) **Site-specific calibration of the Hanford personnel neutron dosimeter.** Endres, A.W. (Pacific Northwest Lab., Richland, WA (United States)); Brackenbush, L.W.; Baumgartner, W.V.; Rathbone, B.A. Oak Ridge National Lab., TN (United States). Oct 1994. DOE Contract AC06-76RL01830. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A new personnel dosimetry system, employing a standard Hanford thermo-luminescent dosimeter (TLD) and a combination dosimeter with both CR-39 nuclear track and TLD-albedo elements, is being implemented at Hanford. Measurements were made in workplace environments in order to verify the accuracy of the system and establish site-specific factors to account for the differences in dosimeter response between the workplace and calibration laboratory. Neutron measurements were performed using sources at Hanford's Plutonium Finishing Plant under high-specific neutron spectra. The dosimeter was also calibrated using bare and moderated ^{252}Cf sources under low-scatter conditions available in the Hanford Calibration Laboratory. Dose equivalent rates in the workplace were calculated from spectrometer measurements using tissue equivalent proportional counter (TEPC) and multisphere spectrometers. The accuracy of the spectrometers counter (TEPC) and multisphere spectrometers. The accuracy of the spectrometers was verified by measurements on neutron sources with calibrations directly traceable to the National Institute of Standards and Technology (NIST).

11156 (ORNL/TM–12817, pp. 163) **Field evaluation of bubble dosimeters at Los Alamos National Laboratory.** Romero, L.L. (Los Alamos National Lab., NM (United States)); Hoffman, J.M.; Devine, R.T. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The longevity and stability of BD-100R bubble dosimeters purchased from Bubble Technology Industries have been evaluated to determine their use in personnel neutron dosimetry at Los Alamos National Laboratory. One hundred and fifteen dosimeters with varying degrees of sensitivity were evaluated over a period of one year. Fifty dosimeters were used routinely in various operations, and thirty seven dosimeters had some occasional use. Operational dosimeters were re-calibrated at three month intervals using Cf-252. The compressing mechanism of thirty two dosimeters failed after using the dosimeters over a period of time, therefore could not be re-calibrated. Preliminary results showed no significant changes in sensitivity over the one year period. However, dosimeters significantly under-responded at 350-400 bubbles per dosimeter due to the situation associated with the image reading system.

11157 (ORNL/TM–12817, pp. 165-174) **Personal neutron dosimetry-conversion factors, calibration and dosimeter performance.** Alberts, W.G. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)); Luszik-Bhadra, M.; Siebert, B.R.L. Oak Ridge National Lab., TN (United States). Oct 1994. Contract FI3P-CT92-0002. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The recent recommendations on dose equivalent conventions established by ICRU and ICRP particularly affect neutron radiation. The change in the fluence-to-dose equivalent conversion factors requires a change in the desired response of a dosimeter as a function of energy of incident neutrons. This response can be investigated with monoenergetic neutron beams which are available at the PTB. Performance of personal dosimeters, with respect to the energy dependence of their response should also be tested in calibration fields providing well known, broad neutron spectra or in neutron fields encountered in routine surveillance. This can be done by calculations once the fluence response as a function of

energy is known. This is demonstrated by two examples of recent investigations at the PTB involving the measurement of responses of personal dosimeters in the range from thermal neutrons up to 20 MeV, one dosimeter based on a track-etch technique and the other being a commercial electronic pocket dosimeter. The more or less strong dependence of the dose equivalent response on neutron favours the development of dosimeters with intrinsic spectrometric properties.

11158 (ORNL/TM–12817, pp. 175-186) **Angular variation of the personal dose equivalent, H_p (0.07), for beta radiation and nearly monoenergetic electron beams: Preliminary results.** Silva, T.A. da (National Institute of Standards and Technology, Gaithersburg, MD (United States)); Soares, C.G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Using the NIST standard beta-particle radiation sources, as well as the NIST nearly-monoenergetic electron beams, the angular variation of the personal dose equivalent, H_p (0.07), was experimentally determined. Measurements were performed with the NIST standard extrapolation chambers, and with thermoluminescent detectors covered with 7-mg/cm^2 thickness of tissue equivalent material on a slab phantom. Extrapolation chamber correction factors, which are functions of energy and angle of incidence, were determined.

11159 (ORNL/TM–12817, pp. 187-197) **A tabulation of absorbed dose per unit fluence conversion coefficients for slab phantoms of three tissue equivalent materials for electron energies from 70 keV to 10 MeV.** Gualdrini, G.F. (ENEA-AMB, Bologna (Italy)); De Maio, U.; Padoani, F. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

After the publication of the "1990 Recommendations of the International Commission on Radiological Protection" (ICRP 60), an ICRP/ICRU Joint Task Group was set up to revise the ICRP Publication 51 "Data for Use in Protection Against External Radiation". In this framework a particular effort was devoted to providing new data for electron and beta radiation due to the present lack of a complete and homogeneous set of values. A subgroup of the EURADOS WG4 (Numerical Dosimetry) was therefore created as a support to the ICRP/ICR Joint Task Group with the specific aim of providing conversion factors for operational quantities for electron and beta radiation. Six participants (from Europe, USA and Japan) gave contributions, that have been discussed by Grosswendt and Chartier in a forthcoming report. The ENEA contribution to the Task Group dealt with Monte Carlo analyses of electron absorbed dose for slab phantoms of different compositions, which required an extended series of calculations and comparisons to be carried out. The complete set of the results is about to be published as an ENEA report.

11160 (ORNL/TM–12817, pp. 199) **Conversion coefficients for individual monitoring calculated with integrated tiger series, ITS3, Monte Carlo code.** Devine, R.T. (Los Alamos National Lab., NM (United States)); Hsu, Hsiao-Hua. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The current basis for conversion coefficients for calibrating individual photon dosimeters in terms of dose equivalents is found in the series of papers by Grosswent. In his calculation the collision kerma inside the phantom is determined by calculation of the energy fluence at the point of interest and the use of the mass energy absorption coefficient. This approximates the local absorbed dose. Other Monte Carlo methods can be sued to provide calculations of the conversion coefficients. Rogers has calculated fluence-to-dose equivalent conversion factors with the Electron-Gamma Shower Version 3, EGS3, Monte Carlo program and produced results similar to Grosswent's calculations. This paper will report on calculations using the Integrated TIGER Series Version 3, ITS3, code to calculate the conversion coefficients in ICRU Tissue and in PMMA. A complete description of the input parameters to the program is given and comparison to previous results is included.

11161 (ORNL/TM–12817, pp. 201-218) **Age dependence of organ dose from external photon sources computed using a mathematical phantom.** Ward, R.C. (Oak Ridge National Lab., TN (United States)); Hussain, M.T.; Ryman, J.C.; Cristy, M.; Eckerman, K.F. Oak Ridge National Lab., TN (United States). Oct 1994. DOE Contract AC05-84OR21400. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Organ dose and effective dose equivalent from external photon sources are computed using the ALGAMP Monte Carlo transport code for mathematical phantoms of various ages. Estimates of organ dose and effective dose equivalent due to isotropic field and rotational normal beam exposure for a series of monoenergetic photon sources were made for the following mathematical phantoms: newborn, 1-, 5, and 10-year-old adolescents, and a 15-year-old male/adult female, in addition to the adult male. The existing mathematical phantoms were modified to include the esophagus and neck region for all age groups. Adjustments were required to previously defined models for the thyroid and gall bladder in the newborn phantom. The doses were calculated for monoenergetic photon sources with energies in the range 0.01 to 8.0 MeV. In this talk we compare our results with previous calculations on the adult male mathematical phantom as a function photon source energy. Our results, presented as a function of phantom mass, demonstrate the newborns and younger children are more vulnerable to the radiation from comparable photon sources than older children or adults.

11162 (ORNL/TM–12817, pp. 219-222) **Skin dose determination using survey meters and Varskin Mod 2.** Michel, R. (Pacific Northwest Lab., Richland, WA (United States)); Fix, J.J.; McDonald, J.C. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Survey meters are used at almost every radiation worker exit location. These instruments are used as the first means of determining if a worker has been exposed to radiation. However, skin dose from direct skin contamination or contaminated clothing is often undetected at the time of exit because survey meters are not properly calibrated to measure radiation doses, and sometimes, the type of nuclide resident on clothes or skin is unknown. For this study we used three different survey meters, several calibrated sources, and the computer code Varskin Mod 2 to generate conservative action levels to screen radioactive contamination cases that require further analysis. Moreover, a series of tables with conversion factors were produced to determine the skin dose, once the type of nuclide was identified.

11163 (ORNL/TM–12817, pp. 227-233) **A new neutron dose equivalent rate meter with improved neutron energy response in terms of H*(10).** Klett, A. (EG&G Berthold, Bad Wildbad (Germany)); Maushart, R.; Burgkhardt, B.; Fieg, G.; Piesch, E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Conventional neutron dose rate meters make use of thermal neutron detectors such as ^{3}He counters located in the center of a moderator and absorber for thermal neutrons. The various commercial types used up to now have the disadvantage that the reading is extremely energy dependent exceeding a factor of up to 15. The need to improve the energy response and the sensitivity in

the lower dose rate range resulted in joint cooperation between KfK and EG7G Berthold. On the basis of Monte-Carlo calculations and comprehensive calibrations with monoenergetic neutrons at the PTB Braunshweig, a new type of rem-counter has been optimized using a 10 cm x 4 cm diameter ^{3}He-counter. Both calculations and experiments resulted in a lower energy dependence within ±40% in the energy range 20 keV to 19 MeV. The commercially available dose rate meter of 25 cm diameter, with a weight below 10 kg and with a high neutron sensitivity of 3 counts per nSv has a dose rate range of 0.1 μSv/h - 100 mSv/h and low γ-sensitivity. With integrated electronics, this instrument is applicable for routine monitoring as well as for stationary monitoring of radiation fields near accelerators.

11164 (ORNL/TM–12817, pp. 235) **Response characteristics of an extrapolation chamber made at IPEN to X radiation.** Dias, S.K. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Caldas, L.V.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of absorbed dose rates produced by beta or low energy X radiation are often difficult to obtain with accuracy. The recommended instruments for these measurements are extrapolation chambers. A plane parallel ionization chamber of variable air volume of this type was designed and constructed; its performance was tested in the radiation standard beams of the Calibration Laboratory of Sao Paulo. The performance of the chamber was studied in relation to its response linearity and energy dependence. Extrapolation curves were initially obtained for X-rays (25 and 50kV), varying the interelectrode distance between 0.2 and 1.0 mm and keeping the electric field constant at 10 V/mm. The calibration factors were obtained. The obtained results are comparable to those of commercial plane parallel chambers.

11165 (ORNL/TM–12817, pp. 239) **A filter technique for optimizing the photon energy response of a silicon pin diode.** Olsher, R.H. (Los Alamos National Lab., NM (United States)); Eisen, Y. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Silicon PIN diodes have become popular as radiation detectors in electronic pocket dosimeters (EPD), where they are typically used in a pulse mode. However, current mode operation is also possible, especially at high dose rates. Because silicon is neither air nor tissue equivalent, means must be provided to flatten the dosimeter energy response. The problem is most serious in pulse mode because the count rate below 200keV is not proportional to air dose or kerma rates. Most EPDs use a simple filter to flatten the energy response, but at the cost of sacrificing response below 60keV. We present a new and inexpensive approach, which uses a composite filter, to extend the low-energy response of the diode to 15 keV in current mode and 25 keV in pulse mode while maintaining excellent response accuracy to 1.2 MeV in current mode and 6 MeV in pulse mode.

11166 (ORNL/TM–12817, pp. 243) **Development of a calorimetric system for electron beam dosimetry in radiation processing.** Perez, H.E.B. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Campos, L.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A calorimetric system for electron beam dosimetry in radiation processing was developed. The system is composed of a graphite core calorimeter, the temperature measuring and electrical calibrating instrumentation, a microcomputer, and the software for the system automation. The research was directed towards the optimization of the project parameters, the development of advanced methodologies for calibrating the temperature sensor, the determination of the thermal capacity as a function of the temperature, the measurement of the absorbed dose, and the development of the software needed for the system operation. The operating range extends from 0.1 kGy to 30 kGy. The uncertainty in the measurement of the absorbed dose was estimated to be ± 1.8% at the 95% confidence level. Comparative tests of the absorbed dose measurements were made using the IPEN's electron accelerator. The obtained results showed an excellent agreement between the absorbed dose determined by the calorimeter and the absorbed dose calculated from the nominal power delivered by the accelerator.

11167 (ORNL/TM–12817, pp. 245-252) **Use of phototransistor as a radiation monitor.** Dhole, S.D. (Univ. of Poona, Pune (India)); Bhoraskar, V.N. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A sensitive device phototransistor has been used as a radiation monitor which measures the dosages in the range of 10^2 rads to 10^6 rads. The main measured characteristics of the phototransistor was the variation in the collector current (I_C) with collector to emitter voltage (V_{CE}). These parameters were measured before and after irradiation. Calibration was carried out by measuring collector current for each value of V_{CE} for different 1 MeV electron fluences. It was observed that collector current decreases with an increase in radiation dose received by the phototransistor. The outer advantage in the use of this technique is that the transistor current can be changed by varying the incident light intensity which can also be used as a measure of radiation dose. Appropriate calibration of the phototransistor was made with the help of a pocket dosimeter.

11168 (ORNL/TM–12817, pp. 269) **The development of a passive fiber optic sensor system for remote monitoring in low energy gamma environments.** Buckner, M.A. (Oak Ridge National Lab., TN (United States)); Bauer, M.L.; Holcomb, D.E.; Simpson, M.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A passive fiber optic sensor system (PFOSS) capable of verifying the presence of stored special nuclear materials is being developed at Oak Ridge National Laboratory. This system is being developed to reduce the costs, effort, and the exposure of employees associated with inventorying stockpiles of highly enriched uranium at the Oak Ridge Y-12 Plant. Through its research programs in scintillating materials, ORNL has developed a variety of material configurations for use in alpha-, beta-, gamma- and neutron sensitive scintillator detectors. In addition, several concepts that arose from the innovative work with scintillating fiber optics, wavelength-shifting fibers, and plastic scintillators associated with the Superconducting Super Collider are being considered for incorporation into PFOSS.

11169 (ORNL/TM–12817, pp. 271) **How hand-held computers assist facilities with field instrument source and calibration checking to meet the intent of 10 CFR 20 and 10 CFR 835 regulations.** Bailey, W.H. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an advanced computer application that utilizes PCs, hand-held computers and bar codes to collect field instrument source and calibration data. The application was developed in conjunction with 10 CFR 20 and 10 CFR 835 requirements regarding routine instrument operational checking. An advanced programming technique was incorporated which allows the user to create a sequence of specific procedures for each type of instrument. The system can manage a large number of instruments,

regardless of the manufacture. These procedures are then downloaded to Intermec 9445 or the powerful Janus 2020 model hand-held computers with built-in bar code laser scanners. The instrument checking application was developed using C++ for Windows, which provides ease of use when compiling procedures. The paper describes, in detail, how the instrument checking application operates.

11170 (ORNL/TM–12817, pp. 273-282) **Pencil-chamber measurements of backscatter from elongated fields of low-energy x-rays.** Maharaj, H.P. (Radiation Protection Bureau, Ottawa (Canada)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

To facilitate dose calculations for risk assessment purposes, the backscatter from several elongated fields was measured and comparisons were made with similar data used for superficial radiotherapy. A York fullwave rectified generator with a beryllium window x-ray tube was operated up to 81 kVp using aluminum and copper filters in the beam to provide effective energies of 27 and 73 keV. A MDH Radcal 10 x 5-10.3 CT ($3cm^3$) air-equivalent plastic pencil-shaped ionization chamber was utilized with a wood phantom. For x-rays generated at potentials $\leq$400 kVp, the ratio of in-air measurements on the beam axis at a point in space with an without the scattering medium yields the backscatter factor (BSF). Measurements were made with the ionization chamber aligned parallel to the field length and centered on the beam axis at a tube-target-to-phantom surface distance of 50 cm, and were normalized for constant beam output using an in-beam monitor. Various fields were chosen to provide elongation (ratio of field length and width) between 2 to 23. The test fields were converted to their equivalent square or circular field for which the corresponding BSF was determined for comparison. Differences between the mean measured BSFs and those interpolated were observed to be in the range of -12.5% to 6%, and the coefficient of variation of the measured BSFs was estimated to be less than 9.5%. For field elongation >10, the mean measured BSFs were within $\pm$5% of the data. Curve fitting the measured and interpolated data as a function of equivalent fields showed better agreement at 73 keV than 27 keV. The results suggest that the chamber wall is too thick causing significant attenuation of soft photons backscattered from the phantom at 27 keV, and that BSFs for elongated fields can be conveniently and reliably obtained by using the equivalent field method and data in the reference cited.

11171 (ORNL/TM–12817, pp. 285-294) **Dosimetry of mixed radiation using recombination chamber.** Zielczynski, M. (Institute of Atomic Energy, Otwock (Poland)); Golnik, N. Oak Ridge National Lab., TN (United States). Oct 1994. Contract 2 0930 91 01. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Advantages and shortcomings of mixed radiation dosimetry based on recombination detectors are presented. The methods considered here are particularly advantageous for radiation protection dosimetry in the vicinity of high-energy particle accelerators and in other radiation fields with a complex composition and a broad energy spectrum.

11172 (ORNL/TM–12817, pp. 295) **Evaluation of the long term performance of electronic dosimeters in the USA.** Leon, J. (MGP Instruments, Smyrna, GA (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

From 1988 to 1994, many utilities in the USA have incorporated the DMC 90/DMC 100 Electronic Dosimeter into their health physics programs. The system includes an automatic calibrator that tests the dosimeter for dose and dose rates (as a minimum). The CDM computer program keeps a full statistical database on the individual and overall performance evaluation of each unit. Data was gathered from large-scale installation's of DMC's which were used in both outage and non-outage applications. The data shows that the dosimeter population dose measurement accuracy after calibration has a standard deviation of about 1.5%. After five years of operation, the overall calibration factor range has not changed significantly, attesting to the stability and long range reliability of the Silicon Detector System in the DMC units. The comparison data from DMC's and the currently used primary dosimetry (TLD's) is presented.

11173 (ORNL/TM–12817, pp. 297) **Microdosimetry measurements with the RME-III on the space shuttle.** Hardy, K. (USAF Armstrong Lab., Brooks, TX (United States)); Golightly, M.J.; Atwell, W.; Quam, W. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Since December 1988 (STS-27) the USAF Armstrong Laboratory, in conjunction with the NASA Space Radiation Analysis Group, has been conducting microdosimetry measurements on selected high-altitude, high-inclination Space Shuttle mission with the RME-III. The RME-III is a portable, self-contained, active dosimeter system featuring a three-channel tissue equivalent proportional counter (TEPC) which measures particle fluence and computes dose and dose equivalent at operator selected time intervals. The total accumulated absorbed dose and dose equivalent are displayed real time, while the data and the time of the interval dose readings are stored in memory modules for later analysis. Analysis of the time-resolved data permits correlation of the radiation exposure with geographic position, altitude, and spacecraft shielding and orientation. The RME-III has flown on 15 Shuttle missions to date and measurements are in good agreement with other dosimetry measurements made on the Shuttle.

11174 (ORNL/TM–12817, pp. 301-311) **Differing internal dose calculations for the revised 10 CFR 20.** Rhea, T.A. (Science Applications International Corp., Oak Ridge, TN (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The revised 10 CFR 20 allows licensees several ways to calculate internal dose equivalent-related quantities. These include using the Federal Guidance Report No. 11, using the annual limit on intake (ALI), using the derived air concentration (DAC), and using the International Commission on Radiological Protection (ICRP) 26/30 methodology and metabolic models (or a commercially available software package which implements this methodology). The difference in calculated dosimetry results can be important for demonstrating regulatory compliance, especially for significant intakes. A scenario can occur that would cause a licensees to report a significant intake as an overexposure of the applicable limit if only a rudimentary internal dose calculation is performed. An example demonstrating this problem is presented. The simplified dose calculation methods allowed by §20.1003, §20.1202(b)(2), §20.1204(c), and §20.1204(h) are also summarized. The internal dose calculation methodology used by the NRC Radiation Exposure Monitoring and Information Transmittal (REMIT) computer program, which many small- to mid-size licensees use for manipulating and reporting occupational radiation exposure data, is also discussed. Additionally, this paper introduces the principal references used in internal dose assessments and briefly summarizes the major changes resulting from the new Part 20.

11175 (ORNL/TM–12817, pp. 313) **The Department of Energy's Laboratory Accreditation Program for internal dosimetry.** Taylor, T.L.; Grothaus, G.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994).

In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE Laboratory Accreditation Program (DOELAP) is administered by DOE's Radiological And Environmental Sciences Laboratory (RESL) at the Idaho Operations Office. DOELAP's function is to assure and improve the quality of data from DOE contractor facilities for personnel dosimetry. While the external dosimetry DOELAP has been operating for several years, the internal dosimetry DOELAP is in a pilot testing stage. Pilot tests for both indirect and direct radiobioassay programs are in different stages of completeness. Both programs have between 15 and 20 participating laboratories. The indirect radiobioassay (in-vitro) program have two testing matrices, urine and fecal. Two sets of the fecal matrix and one set of the urine matrix pilot studies have been completed. Laboratory response (reporting results) and interest in participating has been very good.

11176 (ORNL/TM–12817, pp. 315-325) **"In Vivo" measurements performed within an international intercomparison program for whole body counters using a "four years old" phantom.** Bravo, T.N. (Radiological Protection Division, Madrid (Spain)); Ponte, M.A.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The HML (Human Monitoring Laboratory, Ottawa, Ontario), which is Canada's National Calibration Reference Centre for In-Vivo Monitoring, has organized an International Intercomparison program for Whole Body Counting facilities to perform measurements with a small BOMAB phantom equivalent to a 4-year old child, constructed following the reference values of ICRP-23. The principal advantage of Whole Body Counting and the reason it is used as a control method in Radiological Protection, is that it provides a direct measurement of X and gamma radiations emitted from radionuclides internally deposited in the body by inhalation or ingestion, through a would, or through skin absorption. The Whole Body Counter of CIEMAT (Madrid, Spain) has completed successfully the measurements related with the Intercomparison Program and has sent the results to the HML, having received a preliminary report in response. This partial report, which was sent after the European part of the Intercomparison program had been completed, shows a close agreement between the estimates and the real values of the Activities in the P4C Phantom. Then, the facility disposes of a good group of calibration functions depending on the size of the subject, which make really effective the Whole Body Counter of CIEMAT.

11177 (ORNL/TM–12817, pp. 327-335) **Results on substituting the NaI by a Ge detector in a simple shadow shield whole body counter.** Sahre, P. (Nuclear Engineering and Analytics Inc., Dresden (Germany)); Schoenmuth, Th.; Thieme, K. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Since 1976 a whole body counter (WBC) has been used at the Rossendorf Research Centre for measuring the internal contamination of workers. The HP Ge detector (n-type, efficiency 43%) was substituted for a 3 x 3 NaI(Tl) detector. From the simple substitution, without any modification of the WBC construction the following improvements have been achieved: (1) Clear nuclide identification; (2) Decrease of the lower limit of detection from about 100 Bq to about 60 Bq, or reduction of the measuring time from 2000 s to 1000 s; (3) Faster availability of the analysis results by using a commercially available spectrum analysis software package; and (4) Simpler calibration of the WBC due to the use of a multiline emitter.

11178 (ORNL/TM–12817, pp. 337) **Dose contribution from organically bound tritum after an acute tritiated water intake.** Trivedi, A. (Radiation Biology and Health Physics Branch, Chalk River, Ontario (Canada)); Galerui, D.; Richardson, R.B. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

To assess the dose contribution from retained organically bound tritium (OBT), we have analyzed urinary excretion data from eight individuals who had an acute intake of tritiated water (HTO). The analysis of the bioassay data showed that the mean body water turnover half-time was 6.3 $\pm$ 1.0 d and 8.4 $\pm$ 1.9 d for the period of increased water and normal water intake respectively. The long term excretion of tritium was also observed, indicting the tritium incorporation and retention in the organic components of the soft tissues. A mathematical model is proposed to estimate the dose increases from the retained OBT by examining the kinetics of tritium excretion in urine. Based on the kinetics of tritium in urine, the average dose increase from the metabolized OBT was 6.2 $\pm$ 1.3% of the HTO dose. The uncertainty in the OBT dose estimates was calculated to be less than 50%.

11179 (ORNL/TM–12817, pp. 339-344) **New method for Sr-90 determination in liquid samples by liquid scintillation counting.** Alvarez, A. (Radiological Protection Division, Madrid (Spain)); Navarro, N.; Salvador, S. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Strontium-90 is a fission product with a chemical similarity to calcium and a long biological half life. For this reason, its measurement has received considerable attention for monitoring persons exposed to the risk of internal contamination. The isotopes of dominant concern for strontium internal dosimetry are ^{90}Sr and its daughter ^{90}Y. These radionuclides are found in equilibrium to each other in virtually all circumstances under which exposure is likely. Urine sample analysis is the easiest and most common bioassay method for ^{90}Sr, and therefore the urinary excretion function becomes the key for internal dosimetry evaluations of strontium. Both, ^{90}Sr and its daughter ^{90}Y, are pure beta emitters, and its determination is usually made measuring the beta total activity in a proportional gas counter, after a chemical separation. Traditionally, this separation has been performed using ion exchange columns or selective precipitations of nitrates, cromates or carbonates, being in general tedious analytical procedures, and very time-consuming. Recently, a new chromatographic extraction material has appeared that separates quickly and effectively strontium from nitric acid solutions. This material, denominated Sr.Spec is composed by macrocyclic polyethers (crown ethers) dissolved in aliphatic alcohols or ketones, and is commercially available as resine or packed columns. Its application to the Sr^{90} isolation simplifies considerably the analysis of this radionuclide. In this work a new method based on the utilization of this material is proposed. The activity measurement is made by liquid scintillation technique. In this way, is possible to determine Sr_{90} activity from a quick measurement. The method has been applied to urine samples, but it is also applicable to any liquid sample.

11180 (ORNL/TM–12817, pp. 345-354) **Determination of transuranic DAC equivalent from CE-144 concentrations.** Stretch, C.D.; O'Connor, E.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The development of a reliable empirical method to determine the DAC (Derived Air Concentration) equivalent relative to observed Ce-144 concentrations for the transuranic (TRU) nuclides Pu-238, Pu-239/240, Pu-241, AM-241, Cm-242, and Cm-243/244 is documented. The analytical methodology used to determine the relationship between TRU and Ce-144 concentrations, the practical implant identification of TRU DAC for air samples, the DAC equivalent set point for the BAB (Beta Aerosols Beacon) Monitor, and the comparison between the observed TRU DAC and the empirical TRU DAC will be presented.

11181 (ORNL/TM–12817, pp. 355) **Proposal of a bioassay program for workers of the thorium nitrate purification facility at the IPEN-CNEN/SP.** Gaburo, J.C.G. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Oliveira, E.E.M.; Sordi, G.M.A.A.; Lipsztein, J.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The operations involved in the Thorium Nitrate Purification Process at the IPEN-CNEN/SP are briefly described. The main radioactive sources and the health physics procedures implemented are given. The techniques and the results of in vitro and in vivo analyses are shown and discussed. Finally a bioassay program for thorium workers is proposed and some recommendations are given.

11182 (ORNL/TM–12817, pp. 357-365) **Dose dependent qualitative analysis of the effects of tritiated water (HTO) on the developing mouse cerebellum from 15th day Post - Coitum.** Jain, N. (S.K. Government P.G. College, Jaipur (India)); Bhatia, A.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation of tritium toxicity in the developing mouse brain has demonstrated that the cerebellum is fairly vulnerable to tritium exposure even in young adult mice. Tritium toxicity in the postnatally developing mouse cerebellum with respect to the radiopathological changes has also been reported. In the absence of adequate dose response data on inhaled beta emitting radionuclides in man, it is necessary to obtain such information in experimental animals. This presentation is an attempt to look into the toxicity of tritium on the cerebellum of developing Swiss albino mice and hence, to collect such dose response data which are necessary to establish the safety standards for the personnel involved with radiation protection programs.

11183 (ORNL/TM–12817, pp. 369) **External exposure to arbitrary distributions of radionuclides in soil.** Ryman, J.C. (Oak Ridge National Lab., TN (United States)); Eckerman, K.F. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A program has been developed for MS-Dos personal computers which can generate dose coefficients for arbitrary distributions of radionuclides as a function of depth below the air-ground interface, using superposition of the dose coefficients for the monoenergetic planar sources. Coefficients can be computed for any of the 825 radionuclides having decay data in Publication 398 of the ICRP. Uniform and exponentially-distributed analystical source distributions are also available between any two depth boundaries. Coefficients are available both in SI and traditional units for individual organ, for effective dose equivalent as formulated in ICRP Publication 26, and for effective dose as formulated in ICRP Publication 60.

11184 (ORNL/TM–12817, pp. 397-406) **Methodology for performing surveys for fixed contamination.** Durham, J.S. (Pacific Northwest Lab., Richland, WA (United States)); Gardner, D.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a methodology for performing instrument surveys for fixed contamination that can be used to support the release of material from radiological areas, including release to controlled areas and release from radiological control. The methodology, which is based on a fast scan survey and a series of statistical, fixed measurements, meets the requirements of the U.S. Department of Energy Radiological Control Manual (RadCon Manual) (DOE 1994) and DOE Order 5400.5 (DOE 1990) for surveys for fixed contamination and requires less time than a conventional scan survey. The confidence interval associated with the new methodology conforms to the draft national standard for surveys. The methodology that is presented applies only surveys for fixed contamination. Surveys for removable contamination are not discussed, and the new methodology does not affect surveys for removable contamination.

11185 (ORNL/TM–12817, pp. 407) **Calibration of surface contamination monitors at IPEN/Sao Paulo.** Caldas, L.V.E. (Instituto de Pesquisas Energeticas e Nucleares-CNEN/SP, Sao Paulo (Brazil)); Xavier, M. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The need for effective monitoring of surface contamination is quantified in terms of activity per unit area; this quantity is used to specify the derived limits that are incorporated in the national regulations of radiation protection. These regulation recommend the calibration of all health physics instruments every 12 months. In the case of surface contamination monitors, a special set-up and a method were developed at the Calibration Laboratory of Sao Paulo, using standard alpha and beta radioactive sources. The monitors are being calibrated in the standard radioactive fields of Americium 241, Carbon 14, Chlorine 36, and Strontium 90 and Yttrium 90 sources, and the instrument efficiency is determined for each case in the range of 0.5 to 1.5 cm (alpha radiation) and 0.5 to 5.0 cm (beta radiation). Moreover, all instruments are being normally tested with Americium 241 sources of different activities. Instruments of different manufacturers and types were used for this study.

11186 (ORNL/TM–12817, pp. 411) **Radium equivalent activity of building materials and gamma ray dose rates in ordinary houses of Sao Paulo, Brazil.** Campos, M.P. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Pecequilo, B.R.S. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The external radiation exposure from natural radioactivity represents, approximately, 50% of the average annual dose caused to the human body by all natural and artificial radiation sources. Natural radioactivity in building materials is the most important source of external radiation exposure in dwellings because of the gamma rays emitted from potassium 40 and member of the uranium 238 and thorium 232 decay chains. Concrete is one of the most potential sources of elevated radiation exposure, however, little is known about the natural radioactivity of Brazilian construction materials. A study to predict the exposure rates of several ordinary houses built almost of concrete, consisting of 38 samples of 6 different materials was conducted by using high resolution gamma-ray spectrometry. The radium equivalent activity was calculated for all 38 samples in order to compare the specific activities of the construction materials containing different amounts of radium, thorium, and potassium. The effective dose rate due to the indoor gamma radiation from the building materials was performed following the 1988 UNSCEAR procedures.

11187 (ORNL/TM–12817, pp. 425-428) **Status of the revision of ANSI N13.27, "Performance specifications for pocket-sized alarming dosimeters/ratemeters".** Bogard, J.S. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A working group of the Health Physics Society Standards Committee (HPSSC) was formed in June 1993 to revise ANSI N13.27-1981: Performance Specifications for Pocket-Sized Alarm Dosimeters and Alarm Ratemeters. The existing standard was inadequate to address performance capabilities of electronic personnel dosimeters (EPDs). The working group (WG) composition reflects a cross-section of organizations that will manufacture, test, use, or regulate the use of alarming dosemeters and ratemeters for personnel radiation dosimetry and radiation protection programs. Technical issues which must be addressed by the WG are primarily related to the development of suitable performance tests for active devices which estimate and record both dose and dose rate while, at the same time, providing alarming capabilities for exposure control, since the most well-developed performance standards available are applicable to passive integrating devices with limited utility for real-time exposure control.

11188 (ORNL/TM–12817, pp. 429) **The DOE Laboratory Accreditation Program performance testing laboratory automated calibration verification program.** Cummings, R. (Idaho Operations Office, Idaho Falls, ID (United States)); Kershisnik, R.; Holloway, R. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The Performance Testing Laboratory for the DOE Laboratory Accreditation Program (DOELAP) resides at the Radiological and Environmental Sciences Laboratory (RESL) on the Idaho National Engineering Laboratory (INEL). A system has been developed to verify the calibration of Cesium 137 irradiators using a reference class ionization chamber under computer control. The measurement system consists of irradiators, a Victoreen Model 415 ionization chamber, a Keithley Model 617 electrometer, a high voltage power supply, a VAXLAB microVAX II processor controller, a Fluke digital thermometer, a Heise digital barometer and an Optomux interface between the computer and irradiator. The ionization chamber is placed in an irradiation fixture which is affixed to the dosimeter phantom stand. The computer then executes a variety of steps to conduct the irradiation and measurement. The data taken over the last six months indicate that all of the irradiator geometries meet requirements in the governing standards.

11189 (ORNL/TM–12817, pp. 431) **The DOE Laboratory Accreditation Program 8 years later.** Cummings, R. (Idaho Operations Office, Idaho Falls, ID (United States)); Kershisnik, R.; Taylor, T.; Grothaus, G.; Loesch, R.M. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE Laboratory Accreditation Program was implemented in 1986. Currently, the program is conducting its seventeenth performance testing session for whole body personnel dosimeters. All but two DOE laboratories have gained accreditation for their whole body personnel dosimetry systems. Several test situations which were anticipated in the early stages of DOELAP have not materialized. In addition, the testing standard for whole body personnel dosimetry systems is under review and revision. In the near future, the accreditation programs for extremity dosimetry and bioassay will be implemented. This presentation summarizes the status and anticipated direction of the DOE whole body and extremity dosimetry and bioassay laboratory accreditation program.

11190 (ORNL/TM–12817, pp. 433) **Recent changes in accreditation philosophy.** Loesch, R.M. (Department of Energy, Washington, DC (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A revised ANSI N13.11 was finally published in 1993, which incorporated several changes, including the addition of AmBe in lieu of ^{252}Cf as a bare neutron source. In 1993, ISO Working Group 2 approved several new phantoms to be used for all radiations in the accreditation of personnel dosimeters. With these phantoms came a recommendation as to the proper use of correction factors. ISO WG15 is also developing a standard for the accreditation of personnel dosimeters. However, in concert with European community philosophy, the standard will distinguish between type testing and accreditation. In 1994, a proposal was put forth to the Council on Ionizing Radiation Measurements and Standards (CIRMS) that the US also take this approach. These and other recent changes including recommendations of the ICRU and the increasing interest in electronic dosimeters are currently being considered in the rewrite of DOE's Standard on the Accreditation of Personnel Dosimeters.

11191 (ORNL/TM–12817, pp. 435) **Neutron field characterization for a calibration laboratory.** Ghilardi, A.J.P. (Universidade de Sao Paulo, Ribeirao Preto (Brazil)); Lee, E.B.; Casson, W.H.; Bogard, J.S. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

When measurement instruments for neutrons are calibrated with a isotopic neutron source in a calibration room, the response is not only to direct radiation from the source but also to neutrons scattered by the air and room. The calibration should be corrected using the vacuum source spectrum as a reference value, which would exclude neutron scattering processes which affects the total fluence and the neutron spectrum which hits the detector. The objective of this research is the neutron source characterization for different irradiation conditions by using a multisphere spectrometer and other types of neutron detectors. Computational methods are necessary to determine the fluence, dose and dose equivalent at the detector position. Appropriate corrections are introduced for air and room neutron scattering specific for the subject detector.

11192 (ORNL/TM–12817, pp. 437) **Neutron calibration facilities.** Riel, G.K. (Naval Surface Warfare Center, Silver Spring, MD (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

We just built two neutron calibration facilities: one for monoenergetic neutrons and one with an AmBe source that operates in high and low scattering environments. we have standard fields for calibrating dosimeters and challenging spectra for assessing their performance in the real world. The NSWC Tandem Accelerator produces monoenergetic neutrons by bombarding Lithium with protons. We can accomodate remmeters and other large devices, such as a 40X40X20 cm phantom for albedo dosimeters. the calibration laboratory is about eight meters square by seven meters high. It is divided into low and high scatter bays by a light metal grid at ground level. Some scattering cannot be avoided, built we find the response to unscattered radiation by a regression of response with distance. Comparisons with NIST, DOD, and DOE calibration laboratories give us confidence in the results.

11193 (ORNL/TM–12817, pp. 439-448) **Calibration of reference neutron fields for dosimeter and criticality alarm validation and intercomparison.** Stanka, M.B. (Army Pulse Radiation Facility, Aberdeen Proving Ground, MD (United States)); Harrison, R.C. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The APRF operates a fast burst reactor for radiation hardening of electronics, radiation transport code validation, and dosimetry testing. Radiation environments have been developed for the validation and intercomparison of personnel dosimeters and criticality alarm systems. These fields can be varied in their dose rates, neutron to gamma-ray ratios, and time profiles. For personnel

dosimeters, the emphasis has been on developing well-characterized, stable fields with appropriate neutron and gamma dose levels. This has been achieved by adding material between the reactor and the dosimeter. Also, the distance from the reactor to the dosimeter may be varied. For critically monitor testing, the time history of the applied dose is of more significance. Dose profiles may be provided through steady-state, short pulse, wide pulse, or fast ramp operations. Combinations of converters and time profile may be combined in almost any combination to supply the desired environment for a given test.

11194 (ORNL/TM–12817, pp. 503-507) **The importance of radioprotection controls in nuclear medicine.** Sahyun, A. (Instituto de Pesquisas e Nucleares, Sao Paulo (Brazil)); Sanches, M.P.; Sordi, G.M.A.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In nuclear medicine the main objective of radioprotection controls is to protect three people groups from external and internal radiation. To obtain this goal, the dose limitation system has to be followed firmly and for that, basic procedures have to be introduced. These basic procedures are the result of several activities which have to be balanced, one against the other to be effective. The aims of radioprotection are to ensure that people are not exposed to doses enough to cause radiation symptoms and to limit the doses of radiation. This is achieved by the use of shielding, containment, careful design and operating and administrative procedures. This paper presents a small list of general radioprotection problems found in nuclear medicine and establishes some rules to the job schedule and control measures to be followed in favor of safety. By considering the general radioprotection problems, a number of factors of substantial relevance in the control of external and internal doses can be deduced and emphasis properly placed. Work with radioactive material should be concentrated on a limited number of work rooms. Good radioactive materials inventory are essential because of the potentially large diversity of material and users. Storage of radioactive materials ensure that the public is not unnecessarily exposed. Appropriate monitoring equipment should be available within each working site. Line management commitment to safety has led to a heightened awareness for those control measures which encourages individuals to review and improve their own work rules. Investment in training programs, plant modifications and written procedures provide the necessary resource to support the dose reduction initiatives.

11195 (ORNL/TM–12817, pp. 509) **Radiation protection in hospitals.** Vetter, R.J. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Hospitals contain a variety of sources that may contribute to occupational and public radiation doses. Engineering design, training, administrative controls, and quality control are used to minimize doses. Changes in consensus standards and regulations have reduced the annual permissible effective dose to members of the public and the lifetime occupational dose. Hospital radiation protection and monitoring programs must take advantage of the latest developments in radiation protection and radiation monitoring techniques to keep occupational and public doses as low as reasonably achievable. This paper will describe the radiation protection program of a broad scope medical licensee, describe efforts to reduce radiation doses, and discuss trends in doses to employees and the public.

11196 (ORNL/TM–12817, pp. 511-514) **Occupational health experience in the production and distribution of radionuclides used in medicine.** Gaburo, J.C. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)); Sanches, M.P.; Gian, M.A.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A brief description of the main operations performed in the Radioisotope Production Facility at IPEN-CNEN/SP is presented. This facility is provided with hot cells which must be periodically replaced due to deterioration by reagent processing and hard treatment to which they are submitted. When the lifetime of these hot cells are at their limit, leaking of airborne materials arises bringing forth incorporation by workers. As a safe control, a series of procedures have been implemented in a program of internal monitoring by urine sampling and external monitoring by film badge. From this program it became possible to evaluate the radiation dose received by workers. The results obtained within the last 10 years where analyzed against the lifetime of the hot cells and studies were made to verify possible explicit or implicit relations between doses and the natural stress of these hot cells. In the distribution of the effective dose equivalent among 304 workers submitted for individual monitoring of internal exposure by urine samples, some significant exposures higher than 4.5 mSv. The sum of effective doses and doses from external exposures can lead to levels close to regulatory limits. The internal effective dose equivalent is small when compared with whole body external dose equivalent, however it is not negligible.

11197 (ORNL/TM–12817, pp. 515-521) **Verification of radionuclide calibrators used in nuclear medicine laboratories in the Czech and Slovak republics.** Suran, J. (Czech Metrological Institute, Prague (Czechoslovakia)); Jasanovsky, P.; Dryak, P. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In order to obtain a reliable diagnostic statement or to carry out an efficient therapy while keeping the unnecessary exposure of the human body as low as possible the precise activity determination of the applied preparation is necessary. The Czech Metrological Act requires regular annual check of devices measuring the activity of the diagnostic and therapeutic preparations applied to patients "in vivo". This control is performed by the Inspectorate for Ionizing Radiation (IIR) which belongs to the Czech Metrological Institute (CMI). In the Czech and Slovak republics there are 57 nuclear medicine and therapy units using seven types of radionuclide calibrators produced in the USA: Nuclear Chicago, Picker Corporation, Victoreen, Germany: PTW Freiburg, Robotron, and Czechoslovakia. This paper presents results of checking their calibration constants for mostly used radionuclides 131-I and 99m-Tc.

11198 (ORNL/TM–12817, pp. 523) **Calibration of clinical dosemeters in the IAEA water phantom.** Caldas, L.V.E. (Instituto de Pesquisas Energeticas e Nucleares-CNEN/SP, Sao Paulo (Brazil)); Albuquerque, M.P.P. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The procedures recommended by the IAEA Code of Practice were applied at the Calibration Laboratory of Sao Paulo in order to provide in the future the clinical dosemeters users with absorbed dose to water calibration factors for Cobalt 60 radiation beams. In this work the clinical dosemeters were calibrated free in air and in water, and the results were compared, using conversion factors. The several tested clinical dosemeters of different manufacturers and models belong to the laboratory and to hospitals. For the measurements in water the IAEA cubic water phantom was used. The dosemeters were all calibrated free in air in terms of air kerma, and the calibration factors in terms of absorbed dose to water were obtained through conversion factors. the same dosemeters were also calibrated into the water phantom. Good agreement was found between the two methods, the differences were always less than 0.5%. The data obtained during this work show that when the

dosemeters are used only in Cobalt 60 radiation and the users apply in the hospital routine work the IAEA Code of Practice, the calibration can be performed directly in the water phantom. This procedure provides the useful calibration factors in terms of absorbed dose to water.

11199 (ORNL/TM–12817, pp. 525) **Cutaneous mitochondrial protection by topical treatment of herbal antioxodiants following 60 Co-gamma irradiation.** Ashoori, Faramarz (Kyoto Univ. School of Medicine, Kyoto (Japan)); Takahashi, Rei; Zhou, Jain; Sugiyama, Taketoshi; Nishigaki, Ikuo. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

To find out the effective dose of herbal antioxidants to elevate the cutaneous lipid peroxidation (LP) at optimal level, gamma irradiation of cutaneous microsomal fraction was performed at different doses and 200 Gy was chosen. The present findings indicate that the failure of succinate in suppression of mitochondrial LP of irradiated rats might be due to diminishing of mitochondrial antioxidants which had been reduced by free radicals (generated by irradiation), since succinate suppressed mitochondrial LKP in antioxidant-treated rats. From these points of view, topical application of either curcumin or ellagic acid could be beneficial in prevention of radiation skin cancer.

11200 (ORNL/TM–12817, pp. 527) **Dosimetry of electron and gamma radiation with DL-alanine.** Costa, Z.M. (Instituto de Pesquisas Energeticas e Nucleares-CNEN/SP, Sao Paulo (Brazil)); Campos, L.L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports the application of powder DL-alanine/ESR dosemeter for measurement of the absorbed dose of Cobalt 60 gamma rays and electron beams. The sample preparation details are described, as well as the analysis of the ESR signal to dose, the energy response, the influence of dose rate and effect of the ambient conditions on the fading of the ESR signal. The irradiations were performed using a panoramic Cobalt 60 gamma ray source and electron emitted from an accelerator for industrial purposes. The obtained results give useful information on the care necessary to obtain the needed overall accuracy in the determination of absorbed doses.

11201 (ORNL/TM–12817, pp. 529-537) **Sensitivity improvement of Fricke dosimeter for 14 MeV neutrons.** Nagesh, N. (Univ. of Poona, Pune (India)); Pansare, G.R.; Bhoraskar, V.N. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

For several applications, it may be necessary to know the neutron dose in terms of the energy deposited in a medium. Neutron flux monitors have been developed for fast neutrons, which provide information in terms of neutrons incident in the detectors, but in several cases it is difficult to distinguish fast neutron flux from that of the low energy neutrons. In this paper, measurements of 14 MeV neutron dose using improved Fricke dosemeter systems are reported. The Ferrous Sulphate dosemeter, known as the Fricke dosemeter was used for the determination of dose rate and flux of the MeV neutrons produced.

11202 (ORNL/TM–12817, pp. 539) **The Los Alamos National Laboratory Nuclear accident dosimeter: Overview and recent developments.** Buhl, T.E. (Los Alamos National Lab., NM (United States)); Casson, W.H.; Hoffman, J.M.; Upp, D.L.; Romero, L.L.; Vasilik, D.G. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The design and operation of the nuclear accident dosimeter (NAD) now being used at Los Alamos National Laboratory (LANL) will be described. The presentation will include an overview of the dosimeter and its components, a description of the methods used to analyze each dosimeter foil, and a discussion of the procedure determining the radiation dose based on the dosimeter results. A user friendly computer program has been developed to calculate the absorbed dose using this procedure. Recent and anticipated improvements in the dosimeter will be discussed. Results of recent exposures of the NAD using LANL's Godiva IV and SHEBA II critical assemblies will be presented. LANL is planning continued use of these assemblies, and initiating a nuclear accident dosimeter intercomparison program.

11203 (ORNL/TM–12817, pp. 541) **A routine chemical dosimetric system using the modified ceric sulphate dosimeter.** Yamanaka, L.K. (Instituto de Pesquisas Energeticas e Nucleares-CNEN/SP, Sao Paulo (Brazil)); Caldas, L.V.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The radiolytic reduction of the Ce4+ in a 0.8N sulfuric acid was examined, with the objective of measuring large radiation doses. the ceric sulphate dosimeter was tested in the range from 1 to 20kGy. The 0.01 M sodium oxalate solution was chosen instead of the arsenious oxide solution (used in the conventional method), in order to obtain a less expensive dosimetric system than that normally use for routine chemical dosimetry. The absorption spectrum of the Ce^{4+} solution presents an absorption peak at 370 nm; the obtained molar extinction coefficients of Ce^{4+} and Ce^{3+} were 5670 and 2.7 M^{-1} cm^{-1} respectively. The purpose of this work was to establish a simple, reliable and inexpensive routine chemical dosimetric system for high doses.

11204 (ORNL/TM–12817, pp. 547) **Ionizing radiation dosimetry based on optical parameters width measurements of oxides.** Abdukadyrova, I.Kh. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This work is aimed at the investigation of the spectroscopic characteristics and the Cobalt 60 gamma ray effects on oxides in a reactor. The purpose of this investigation is the determination of the growth kinetics of radiation damage, their stability, dependence on radiation dose, irradiation conditions and the possible use of oxides as a measurement of absorbed dose of neutron and photon emissions. Such parameters as the influence of time storage, irradiation temperature and exposure, dose power, effects of thickness of the sample on the measured parameter, and the possibility of the repeated use of the oxides was studied. The possible use of these crystals and glasses in the dosimetry of neutron and gamma-radiation is suggested on the basis of a dosimetric characteristics analysis.

11205 (ORNL/TM–12817, pp. 551) **Angular dependence of dose equivalent response of an albedo neutron dosimeter.** Torres, B.A. (Georgetown Univ., Washington, DC (United States)); Boswell, E.; Schwartz, R.B. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The ANSI provides procedures for testing the performance of dosimetry services. Although neutron dose equivalent angular response studies are not now mandated, future standards may well require that such studies be performed. Current studies with an albedo dosimeter will yield information regarding the angular dependence of dose equivalent response for this type of personnel

dosimeter. Preliminary data for bare ^{252}Cf fluences show a marked decrease in dosimeter reading with increasing angle. The response decreased by an approximate factor of four. For the horizontal orientation, the same response was noted from both positive and negative angles. However, for the vertical orientation, the response was unexplainably assymetric. We are also examining the response of the personnel badge in moderated ^{252}Cf fluences. Responses from the moderated and unmoderated ^{252}Cf fields and theoretical calculations of the neutron angular response will be compared. This information will assist in building a data base for future comparisons of neutron angular responses with other neutron albedo dosimeters and phantoms.

11206 (ORNL/TM–12817, pp. 553-557) **Comparison of responses of thermoluminescent dosemeters irradiated by soft x-rays at very low and very high dose rate levels.** Pietrikova-Farnikova, M. (Institute of Physics (Czechoslovakia)); Krasa, J.; Juha, L. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Recent great progress in construction and application of bright sources of soft X-rays gave a strong impetus for the development of methods of their dosimetric diagnostics. The soft X-ray sources are primarily represented by synchrotron radiation sources and by sources based on laser-produced plasma, including X-ray lasers. Their characteristics spread over a very wide region of photon energies, peak and average powers and densities. From our preliminary experiments it follows that thermoluminescent dosemeters can serve as a suitable tool for the determination of these characteristics. Problem lies in the fact that routine use of the thermoluminescent dosemeters for the dosimetry of soft X-rays requires their spectral calibration, which can be carried out with low peak power sources (synchrotron radiation and radionuclide sources). On the contrary, many important sources, especially these based on laser-produced plasmas, exhibit a very high peak power, i.e. dosemeters are irradiated at extremely high dose rate. In comparative experiments carried out with laser-produced plasmas and radionuclides using TLD 200 (CaF_2:Dy) and GR 200A (LiF:Mg,Cu,P) it was satisfactorily proven that total thermoluminescent signals are independent of the dose rate. Dependence of glow curve shapes on the dose, dose rate and photon energy were equally determined.

11207 (ORNL/TM–12817, pp. 559) **Establishing a minimum reporting level (gamma) for the personal dosimetry device worn at the Idaho National Engineering Laboratory (INEL).** Perry, O.R. (EG&G Idaho, Inc., Idaho Falls, ID (United States)); Anderson, B.L.; Ruther, P.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The report evaluated various approaches to defining a minimum reporting level (MRL) for personnel thermoluminescent dosimetry (TLS) systems. The evaluations include the traditional statically-based approaches, using lower limit of detection and critical level as well as several unique approaches developed as part of the study. The advantages and disadvantages of each technique are discussed with the conclusion that none of the statistically based methods satisfy the need to provide accurate low-level data without being overwhelmed with apparent false positive values. A unique approach is presented on the premise of optimizing the accuracy of the total monitored dose. This approach requires the analysis of the distribution of TLD results around zero and provides some insight into the performance of TLD systems at very low dose values.

11208 (ORNL/TM–12817, pp. 561) **A new extremity system and performance at INEL.** Perry, O.R. (EG&G Idaho, Inc., Idaho Falls, ID (United States)); Tawil, R.A.; Velbeck, K.J.; Rotunda, J.E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

The TLD Extremity Dosimetry System described herein incorporates the components necessary for Personnel Extremity Monitoring to meet all current and proposed requirements for DOE-LAP, HPSSC, and the HSE in the UK. The automatic, hot gas TLD reader employs a closely controlled linearly ramped readout cycle. The reader interfaces to an application software package that evaluates and manages the generated TLD data. Single and dual element TLD dosimeters and appropriate filtration comprise the extremity detectors. An overview of the current INEL system, monitoring objectives, testing and calibration is presented. Dosimeter response with and without filtration, linearity, angular dependance, residual, and effects of physical damage to the dosimeter were tested. The results of these tests lead to the preliminary conclusion that an extremity dosimeter can be constructed to simultaneously monitor beta and high energy gamma radiation. The tests, results and performance are presented in this paper.

11209 (ORNL/TM–12817, pp. 563) **Improved beta sensitivity under field conditions for the panasonic UD-807 extremity dosimeter.** Flood, J.R. (Tennessee Valley Authority, Chattanooga, TN (United States)). Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Benchmark tests were designed to characterize the sensitivity of the Panasonic UD-807 extremity dosimeter to photon and beta radiations of varying energies. The lithium tetraborate dosimeters are sealed in the plastic used in TVA facilities at the time and sent to Battelle Pacific Northwest Laboratory for irradiation. Processing results showed excellent response to photons of low energy and high energy. The response to low energy beta was very good, but the tests demonstrated a strong under-response to lower energy beta radiation. The Panasonic design, a single element dosimeter, does not permit independent correction of beta response after exposure to mixed beta-gamma fields typical of nuclear facilities. Accordingly, tests were designed to evaluate a variety of materials with characteristics potentially suitable for field use.

11210 (ORNL/TM–12817, pp. 565-573) **Time-dependent, low-dose reporting limit for dosimeters that are taken home at the end of the workday.** Sonder, E. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In routine personnel dosimetry, it is usual to report doses only where the occupational dose (measured dose with background subtracted) is greater than a previously determined reporting limit. The reporting limit, although set administratively, should be justified by an assessment of the errors inherent in the personnel and background dose measurements, and estimates of the probability that a zero exposure will yield a dosimeter response equal to the reporting limit. In the process of determining the best values to use for background subtraction and reporting limits, it was realized that the source of low-dose uncertainty is very much dependent on whether dosimeters are held in racks at the work site or remain with the employee. The External dosimetry Program for the Department of Energy facilities at Oak Ridge, Tennessee, is operated such that dosimeters are taken home by the employee at the end of each workday. This report is a summary of measurements of background radiation in a variety of home locations, and of calculations of the effect of the variation of this background on the uncertainty of low-level occupational dose and on the reporting level.

11211 (ORNL/TM–12817, pp. 575-584) **Modification of dose algorithm for Teledyne 9150 TLD system and performance test of the algorithm via intercomparison studies.** Kim, Jang-Lyul (KAERI, Taejon (Korea, Democratic People's Republic of)); Chang, Si-Young; Seo, Kyung-Won; Yoon, Suk-Chul; Lee, Sang-Yoon; Lee, Hyung-Sub. Oak Ridge National Lab., TN (United States). Oct

1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

To encourage dosimeter processors to evaluate personnel radiation dose more accurately, the Ministry of Science and Technology (MOST) of Korea issued an Ministerial Ordinance on the technical criteria on personnel dosimetry in August 1992 which was very similar to the ANSI N13.11 standard. Korea Atomic Energy Research Institute (KAERI) has modified the dose calculation algorithm of our Teledyne 9150 TLD system to meet the 8 test categories specified in the MOST Ordinance since 1991, and to provide a dosimeter performance test program to all domestic dosimeter processors. This paper describes the modified calculation algorithm, radiation fields used for modifying the existing algorithm, and presents intercomparison results for the performance of the modified algorithm with Atlan-Tech Inc., Oak Ridge National Lab. (ORNL), Japan Atomic Energy Research Institute (JAERI) and Australian Radiation Lab. (ARL). All intercomparison results showed a good agreement between irradiated and evaluated doses within the tolerance level of MOST Ordinance.

11212 (ORNL/TM–12817, pp. 585) **A TLD dose algorithm for mixed fields at a nuclear weapons facility.** Stanford, N.; Passmore, C.N.; Prather, M.; Martin, J.B. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Personnel dosimetry at a nuclear weapons facility typically involves assessment of external dose from a wide range of beta, photon and neutron fields. The nature of the facility allows the possibility that a given radiation worker may receive dose from any mixture of fields during a single monitoring period. To further challenge the system, the specific exposure conditions for any given TLD are generally unknown to the processing group. While some facilities have chosen to issue multiple dosimeter types to each worker to monitor for the different fields, this paper describes a single dose algorithm implemented at Pantex Plant, designed to calculate external dose from an unknown mixture of these fields based on the readings of a single eight element TLD badge. The algorithm takes advantage of the different relative sensitivities provided by the four phosphor types and six filtration configurations, to isolate responses for the photon, beta, and neutron components. Results of synthetic testing as well as comparisons to field measurements are presented.

11213 (ORNL/TM–12817, pp. 587) **A new approach to TLD dose algorithms.** Moscovitch, M. (Georgetown Univ. School of Medicine, Washington, DC (United States)); Rotunda, D.J. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

A new solution was designed and applied to multi-element thermoluminescence dosimetry (TLD) dose algorithm development. A dose algorithm based on this new approach is a fundamentally different approach from conventional algorithms. The algorithm eventually is able to produce its own unique solution to similar, but not exactly the same, dose calculation problems. For personnel dosimetry, the output consists of the desired dose components: deep dose, shallow dose, and eye dose. The input consists of the TL data obtained from the readout of a multi-element dosimeter. For this application, a new architecture was developed based on this concept. This simplifies the problem and results in a relatively simple and reliable dose calculation algorithm. Overall, the performance of the new dose algorithm has been shown to be significantly better than conventional algorithms.

11214 (ORNL/TM–12817, pp. 589) **Automatic screening of abnormal LIF:Mg; Ti glow curves for use in routine dosimetry.** Tan, Y. (Harshaw/Bicron Radiation Measurement Products, Solon, OH (United States)); Rotunda, J.E.; Velbeck, K.J.; Tawil, R.A. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

In routine dosimetry, the dosimetric information is approximated by the integral area under the glow curve. The validity of this practice is ensured by visual screening of glow curves before applying a dose computation algorithm. A simple computer program was specifically developed for large scale routine dosimetry to electronically screen abnormal glow curves of LiF:Mg, Ti mounted in cards. The method presented here identifies glow curves with abnormal patterns by examining a few key features from which information about background and thermoluminescent (TL) signals can be extracted. The underlying criteria for glow curve acceptance/rejection are discussed. These criteria are determined both from those glow curve characteristics dictated by the dosimeter and reader, and from the acceptable limits of parameter values specified by the operator through the provided user interface. The program performance was evaluated by using actual glow curve data provided by users of commercially available readers and dosimeters in routinely high-throughput operations. The initial tests showed a near 100% success rate in identifying glow curves with faulty features (no false positive results) and a minimal rate of rejection of usable glow curves.

11215 (ORNL/TM–12817, pp. 591-596) **Selfdose measurements in routine personal and environmental TLD systems.** Saez-Vergara, J.C. (Radiological Protection Division, Madrid (Spain)); Romero, A.M.; Delgado, A. Oak Ridge National Lab., TN (United States). Oct 1994. Contract FI3P-CT92-0018. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Passive TLD systems are widely used to measure low doses (below 0.15 mSv/month) in personal and environmental monitoring. In order to achieve enough viability in this range it is necessary to characterize the selfdose response of the detector, including phosphor and hanger with metallic and plastic filtrations. CIEMAT has performed different selfdose response of the detector, including phosphor and hanger with metallic and plastic filtrations. CIEMAT has performed different selfdose studies in the UDO Laboratory for the most common TL materials, but this works shows the importance of selfdose in routine equipments such as Panasonic personal and environmental TLD systems. Results on measured selfdose rates show slight differences between phosphors but other parameters can be noticeable. The presence of metallic elements (filters, rings) can increase the selfdose rate more than ten times. Variations in batch production could be also appreciated.

11216 (PNL–10354) **Radiological standards and calibration laboratory capabilities.** Goles, R.W. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007353. Source: OSTI; NTIS; INIS; GPO Dep.

The Radiological Standards and Calibrations Laboratory, a part of Pacific Northwest Laboratory (PNL), performs calibrations and upholds reference standards necessary to maintain traceability to national radiological standards. The facility supports U.S. Department of Energy (DOE) programs at the Hanford Site, programs sponsored by DOE Headquarters and other federal agencies, radiological protection programs at other DOE sites, and research programs sponsored through the commercial sector. The laboratory is located in the 318 Building of the Hanford Site's 300 Area. The facility contains five major exposure rooms and several laboratories used for exposure work preparation, low-activity instrument calibrations, instrument performance evaluations, instrument maintenance, instrument design and fabrication work, and thermoluminescent and radiochromic dosimetry. The major exposure facilities are a low-scatter room used for neutron and photon exposures, a source

well room used for high-volume instrument calibration work, an x-ray facility used for energy response studies, a high-exposure facility used for high-rate photon calibration work, and a beta standards laboratory used for beta energy response studies and beta reference calibrations. Calibrations are routinely performed for personnel dosimeters, health physics instrumentations, photon transfer standards and alpha, beta and gamma field sources used throughout the Hanford Site. This report describes the standards and calibrations laboratory. Photographs that accompany the text appear in the Appendix and are designated Figure A.1 through A.29.

11217 (PNL-SA–20502) **Comparison of computer codes and inputs used at DOE sites to model intrusion scenarios.** Seitz, R.R. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Cook, J.R.; Wood, M.I.; Rittman, P.D.; Wood, D.E.; Napier, B.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920307–104: Waste management '92, Tucson, AZ (United States), 1-5 Mar 1992). Order Number DE95004899. Source: OSTI; NTIS; INIS; GPO Dep.

Scenarios and computer codes used to evaluate intrusion scenarios at different DOE sites are compared and discussed. The purpose of the comparison is to identify differences in the approaches and areas where approaches could be made more consistent without ignoring the need to consider legimate site-specific differences, The comparison is comprised of two steps: (1) benchmarking of CENII and PATHRAE (the two most commonly used codes at DOE sites), and (2) comparison of assumed values for selected input parameters from:scenarios used at the different sites. The results of the benchmarking and parameter comparisons identify fundamental differences in the default assumptions used in the computer codes, as well as differences in the approaches used at the different sites. GENII and PATHRAE are applied to a variety of sites within DOE and other regulatory environments, differences in default assumptions identified in these comparisons are discussed for users to consider when they apply the codes. Furthermore, differences in assumptions made at the different sites disposing of low-level radioactive wastes within Department of Energy are identified to provide an example of how the Performance Assessment Task Team is working to ensure consistent interpretation of performance assessment results.

11218 (PNL-SA–24340) **Practical issues in discriminating between environmental and occupational sources in a uranium urinalysis bioassay program.** Long, M.P. (Pacific Northwest Lab., Richland, WA (United States)); Carbaugh, E.H.; Fairrow, N.L. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411105–4: 40. anniversary conference on bioassay, analytical and environmental radiochemistry, Cincinnati, OH (United States), 15-17 Nov 1994). Order Number DE95007160. Source: OSTI; NTIS; INIS; GPO Dep.

Workers at two Department of Energy facilities, the Pantex Plant in Texas and the Hanford Site in Washington, are potentially exposed to class Y depleted or natural uranium. Since trace amounts of uranium are naturally present in urine excretion, site bioassay programs must be able to discern occupational exposure from naturally occurring uranium exposure. In 1985 Hanford established a 0.2-μg/d environmental screening level for elemental uranium in urine; the protocol was based on log-normal probability analysis of unexposed workers. A second study of background uranium levels commenced in 1990, and experiences in the field indicated that there seemed to be an excessive number of urine samples with uranium above the screening level and that the environmental screening level should be reviewed. Due to unforeseen problems, that second study was terminated before the complete data could be obtained. Natural uranium in rock (by weight, 99.27% ^{288}U, 0.72% ^{235}U, and 0.006% ^{234}U) has approximately equal activity concentrations of ^{238}U and ^{234}U. Earlier studies, summarized by the U.S. Environmental Protection Agency in 51 FR 32068, have indicated that ^{234}U (via ^{234}Th) has a greater environmental mobility than ^{238}U and may well have a higher concentration in ground water. By assuming that the ^{238}U-to ^{234}U ratio in the urine of nonoccupationally exposed persons should reflect the ratio of environmental levels, significant occupational exposure to depleted uranium would shift that ratio in favor of ^{238}U, allowing use of the ratio as a co-indicator of occupational exposure in addition to the isotope-specific screening levels. This approach has been adopted by Pantex. The Pacific Northwest Laboratory is studying the feasibility of applying this method to the natural and recycled uranium mixtures encountered at Hanford. The Hanford data included in this report represent work-in-progress.

11219 (PNL-SA–24763) **Conflicting paradigms in radiation protection: 20 Questions with answers from the regulator, the health physicist, the scientist, and the lawyers.** Strom, D.J. (Pacific Northwest Lab., Richland, WA (United States)); Stansbury, P.S.; Porter, S.W. Jr. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950161–1: Health physics training and education, Charleston, SC (United States), 29 Jan - 1 feb 1995). Order Number DE95007273. Source: OSTI; NTIS; INIS; GPO Dep.

George Orwell's "doublethink" should be generalized to "polythink" to describe the multiplicity of views that radiation protection professionals must simultaneously accommodate. The paradigms, that is, organizing principles and beliefs, that (1) regulators, (2) operational health physicists, (3) scientists, (4) lawyers for the defendant, and (5) lawyers for the plaintiff use in their approaches to radiation protection are presented. What we believe as scientists often conflicts with what we do for purposes of radiation protection. What we need to do merely to protect humankind and the environment from harmful effects of radiation is far less than what we must do to satisfy the regulator, whose paradigm has checklists, score-keeping, and penalties. In the hands of lawyers, our work must overcome different challenges. Even if the paradigms of the operational health physicist, the scientist, and the regulator match, the odds against the lawyers paradigms also matching are astronomical. The differing paradigms are illustrated by example questions and answers. It is important for educators, trainers, and health physicists to recognize and separate the score-keeping, practice, science, and legal issues in health physics.

11220 (PNL-SA–25067) **Radiological control criteria for materials considered for recycle and reuse.** Kennedy, W.E. Jr. (Pacific Northwest Lab., Richland, WA (United States)); Hill, R.L.; Aaberg, R.L.; Wallo, A. III. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411170–1: Residual radioactivity and recycling workshop, Mito (Japan), 9-11 Nov 1994). Order Number DE95004906. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL) is conducting technical analyses to support the US Department of Energy (DOE), Office of Environmental Guidance, Air, Water, and Radiation Division (DOE/EH-232) in developing radiological control criteria for recycling or reuse of metals or equipment containing residual radioactive contamination from DOE operations. The criteria, framed as acceptable concentrations for release of materials for recycling or reuse, are risk-based and were developed through analysis of generic radiation exposure scenarios and pathways. The analysis includes evaluation of relevant radionuclides, potential mechanisms of exposure, and non-health-related impacts of residual radioactivity on electronics and film. The analysis considers 42 key radionuclides that DOE operations are known to generate and that may be contained in recycled or reused metals or equipment. Preliminary results are compared with similar results reported by the International Atomic Energy Agency, by radionuclide grouping.

11221 (RFP–4929) **Designing radiation protection signs.** Rodriguez, M.A.; Richey, C.L. EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-950570–8: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95007690. Source: OSTI; NTIS; INIS; GPO Dep.

Entry into hazardous areas without the proper protective equipment is extremely dangerous and must be prevented whenever possible. Current postings of radiological hazards at the Rocky Flats Environmental Technology Site (RFETS) do not incorporate

recent findings concerning effective warning presentation. Warning information should be highly visible, quickly, and easily understood. While continuing to comply with industry standards (e.g., Department of Energy (DOE) guidelines), these findings can be incorporated into existing radiological sign design, making them more effective in terms of usability and compliance. Suggestions are provided for designing more effective postings within stated guidelines.

11222 (WHC-SD-WM-TI-675) **Test documentation for the GENII Software Version 1.485.** Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005168. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS; GPO Dep.

Version 1.485 of the GENII software was released by the PNL GENII custodian in December of 1990. At that time the WHC GENII custodian performed several tests to verify that the advertised revisions were indeed present and that these changes had not introduced errors in the calculations normally done by WHC. These tests were not documented at that time. The purpose of this document is to summarize suitable acceptance tests of GENII and compare them with a few hand calculations. The testing is not as thorough as that used by the PNL GENII Custodian, but is sufficient to establish that the GENII program appears to work correctly on WHC managed personal computers.

11223 (WSRC-TR-93-604-Rev.1) **Dose Contribution from High Level Waste Uranium and Plutonium. Revision 1.** Chandler, M.C.; Gray, P.L.; d'Entremont, P.D.; Marra, J.E.; Monahon, T.M. Westinghouse Savannah River Co., Aiken, SC (United States). 7 Oct 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060093. Source: OSTI; NTIS; INIS; GPO Dep.

Radiological source terms for safety analyses traditionally have been curie lists of radionuclides. Converting the source term to dose values allows each radionuclide to be evaluated for its impact on dose, which is the purpose of the source term. This report is one in a series of reports establishing source terms for High Level Waste (HLW) by evaluating the dose impact of each radionuclide. These reports will be used in establishing the source terms to be used in HLW Safety Analysis Reports. The purpose of this report is to document the bounding element dose impact of uranium and plutonium in HLW. This technique (use of dose rather than curies) demonstrates vividly the relative importance of these nuclides in accident analyses. A large amount of available data permitted dose values to be established for uranium and plutonium; therefore, these two elements were evaluated independent of other nuclides. Solubility and adsorption data, available for these elements, allow bounding conditions to be established for their contribution to dose for various HLW processes.

11224 (WSRC-TR-95-0006) **Results of Macroinvertebrate Sampling Conducted at 33 SRS Stream Locations, July-August 1993.** Specht, W.L. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060096. Source: OSTI; NTIS; INIS; GPO Dep.

In order to assess the health of the macroinvertebrate communities of SRS streams, the macroinvertebrate communities at 30 stream locations on SRS were sampled during the summer of 1993, using Hester-Dendy multiplate samplers. In addition, three off-site locations in the Upper Three Runs drainage were sampled in order to assess the potential for impact from off-site activities. In interpreting the data, it is important to recognize that these data were from a single set of collections. Macroinvertebrate communities often undergo considerable temporal variation, and are also greatly influenced by such factors as water depth, water velocity, and available habitat. These stations were selected with the intent of developing an on-going sampling program at a smaller number of stations, with the selection of the stations to be based largely upon the results of this preliminary sampling program. When stations within a given stream showed similar results, fewer stations would be sampled in the future. Similarly, if a stream appeared to be perturbed, additional stations or chemical analyses might be added so that the source of the perturbation could be identified. In general, unperturbed streams will contain more taxa than perturbed streams, and the distribution of taxa among orders or families will differ. Some groups of macroinvertebrates, such as Ephemeroptera (mayflies), Plecoptera (stoneflies) and Trichoptera (caddisflies), which are collectively called EPT taxa, are considered to be relatively sensitive to most kinds of stream perturbation; therefore a reduced number of EPT taxa generally indicates that the stream has been subject to chemical or physical stressors. In coastal plain streams, EPT taxa are generally less dominant than in streams with rocky substrates, while Chironomidae (midges) are more abundant. (Abstract Truncated)

11225 (CONF-941139-1) **Resolving the ambiguities: An industrial hygiene indoor Air Quality (IAQ) symposium.** Gammage, R.B. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International workshop on indoor air: an integrated approach; Gold Coast (Australia); 27 Nov - 1 dec 1994. Order Number DE95005391. Source: OSTI; NTIS; GPO Dep.

Resolving the Ambiguities: An Industrial Hygiene (IAQ) Symposium was a one-day event designed to inform practicing industrial hygienists about highlight presentations made at Indoor Air '93. A broad range of topics was presented by invited speakers. Topics included were attempts to deal with guidelines and standards, questionnaires, odors and sensory irritation, respiratory allergies, neuroses, sick building syndrome (SBS), and multiple chemical sensitivity (MCS).

11226 (EGG-2744, pp. 177-183) **Cardiovascular toxicities associated with intravenous administration of p-boronophenylalanine formulations.** LaHann, T.R. (Idaho State Univ., Pocatello, ID (United States)); Sills, C.; Hematillake, G.; Dymock, T.; Daniell, G. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

^{10}Boronophenylalanine (BPA) has been shown to be an effective boron neutron capture therapy (BNCT) of experimental and spontaneously occurring cancers. Calculations indicate that for a given neutron exposure, each doubling of the tumor boron concentration should increase tumor cell kill by a factor of about 10,000. Thus, significant therapeutic benefit would be achieved by delivering the largest possible dose of BPA to tumor. Factors that limit the amount of BPA deliverable to tumor are: (1) the aqueous solubility, and (2) the intrinsic toxicity of the BPA. BPA is poorly soluble in aqueous solution (< 4 g/L at pH 7.4), but formation of a BPA-fructose complex dramatically improves water solubility and allows delivery of high levels of boron to tissues. Little is known about the toxicity of BPA, in part because its poor water solubility has made it difficult to deliver large amounts of drug to animal tissues. Reported LD_{50} values for BPA ranged from 640 mg/kg (i.p., pH 1 solution, rats) to 1,520 mg/kg (i.v., pH 10 solution, mice). Chronic oral and s.c. dosing of BPA suspensions was well tolerated, although the apparent safety of BPA suspensions may more reflect BPA's relative insolubility at physiological pH than its intrinsic toxicity profile. Nevertheless, the prevailing view seems to be that BPA is a relatively safe drug. While assessing the biodistribution of novel BPA-cyclodextrin formulations, the authors noted that i.v. infusion of this formulation could impair cardiovascular and pulmonary function in dogs. To better understand the significance of such an observation,the authors undertook a study of the effects of high dose BPA infusions on the function of the cardiovascular and pulmonary systems. In this paper, the authors report the approximate maximally tolerated dose for i.v. infusion of a BPA-fructose

complex and the effects of high dose BPA infusions on cardiovascular function in the rat.

11227 (ENEA-RT-AMB–94-10) **Effects of active inhalation of trichloroethylene on rat respiratory tract.** Calamosca, M. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Pettinato, G. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. May 1994. 52p. (In Italian). (RT/AMB–94-10). Order Number DE95749717. Source: OSTI; NTIS (US Sales Only).

The effects of an acute inhalation of tricloroethylene (TCE) on the rat respiratory tract have been investigated. In a previous work on mice, the observed damage proved to be limited to Clara cells (CC) and dose-dependent. Injury was correlated with the metabolic properties of CC, where TCE is converted to toxic intermediate metabolites. Since rat CC are located in the distal bronchial tree, a damage at this level is supposed to affect also the mechanical clearance of insoluble particles. Sprague-Dawley, female rats have been exposed for 30min, to a co 30min, to a concentration of 3500 ppm TCE, to investigate the occurrence of an impairment of the mucous-ciliary/alveolar macrophagic (AM) removal system eventually correlated with epithelial damage, whose results are presented in a different pubblication. Nasopharyngeal and bronchopulmonary clearance patterns were obtained from the retention of a radiolabeled carnauba wax control aerosol (0.70 mim CMAD, Sg < 1.08), the rats inhaled 24 h after esposure to TCE. Sequential sacrifices, close together in time, were performed up to 24 h to detect the rapid clearance phase in all the different regions of the respiratory tract; from then on the retention was assessed by in vivo measuring the rats up to 600 h. A new mechanistic model has been designed and applied to the retention data, to achieve the parameters of relative deposition and the rates of clearance. The statistical comparison of the parameter was carried over by means of the bootstrapping method. Even if a major deposition in the bronchial region of the TCE test occurs, no significant differences have been detected between all the parameters describing the clearance both of the bronchoalveolar and nasopharyngeal regions; neither the fraction of sequestered particles in the upper respiratory tract nor the laden AM particles transferred by the mucociliary escalator were significantly different compared with the control test.

11228 (ENEA-RT-INN–94-12) **Study on pesticide's use in Latina and Grosseto (Italy).** Letardi, A. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Rapagnani, M.R.; Caffarelli, V.; Hausmann, C. ENEA, Casaccia (Italy). Area Energia e Innovazione. Mar 1994. 50p. (In Italian). (RT/INN–94-12). Order Number DE95749690. Source: OSTI; NTIS (US Sales Only).

During 1990 ENEA (Italian Agency for New Technologies, Energy and the Envrionment) and AIPA (Association for Agricultural Professional Education) collaborated to realize a preliminary study in order to monitor pesticide's use in Italy. Two field experiments were carried out on the most characteristic crops of Grosseto and Latina to test the suggested methodology. The aim of this study is to report on the results of these field experiments, on the methodology and the object of this research with regards to the wider problem of the agricultural production at the national level.

11229 (KFK-PUG–15) **Regulation of the formation of reactive oxygen intermediates by dust-induced activation of alveolar macrophages.** Gercken, G. (Hamburg Univ. (Germany). Inst. fuer Biochemie und Lebensmittelchemie); Doerger, M.; Schlueter, T. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Umwelt und Gesundheit (PUG). Oct 1994. 54p. (In German). Sponsored by Land Baden-Wuerttemberg, Stuttgart (Germany). Contract PUG L91009. Order Number DE95753826. Source: OSTI; NTIS (US Sales Only).

Bovine alveolar macrophages were activated with dissolved metal compounds combined with quartz dusts or with metal oxide coated silica particles to induce the release of reactive oxygen intermediates (ROI) in order to detect the influence of various heavy metal compounds on the activation mechanism. In addition, specific protein kinase C (PKC) and phospholipase A_2 (PLA_2) inhibitors were applied in order to define the significance of these two key enzymes in the dust-induced activation of NADPH oxidase. Measurement of the respiratory burst was supported by flow-cytometric determination of the cytosolic Ca^{2+} concentration $[Ca^{2+}]_i$, of the intracellular pH $[pH_i]$, and the membrane potential. Increased ROI concentrations were observed with vanadium(IV), whereas the secretion of ROI was inhibited by the calcium antagonists Ni(II) and Ce(III). Most particle-associated metal oxides had no effect on ROI secretion. Only CuO-coated particles decreased and VO_2-coated particles increased the concentrations of O_2^- and H_2O_2. The release of ROI was significantly decreased by the inhibition of PKC as well as PLA_2, the inhibition of PLA_2 showing a much greater effect. The activity of NADPH oxidase after stimulation by dusts is obviously more dependent on the release of arachidonic acid than on the activation of PKC. In contrast to metal-containing dusts, quartz dusts caused a transient increase of $[Ca^{2+}]_i$, pH_i, and a depolarization of the cell membrane. (orig.)

11230 (PNL–8752) **Eielson Air Force Base Operable Unit 2 baseline risk assessment.** Lewis, R.E.; Jarvis, T.T.; Jarvis, M.R.; Whelan, G. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 447p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95003177. Source: OSTI; NTIS; GPO Dep.

Operable Unit 2 at Eielson Air Force Base (AFB) near Fairbanks, is one of several operable units characterized by petroleum, oil, and lubricant contamination, and by the presence of organic products floating at the water table, as a result of Air Force operations since the 1940s. The base is approximately 19,270 acres in size, and comprises the areas for military operations and a residential neighborhood for military dependents. Within Operable Unit 2, there are seven source areas. These source areas were grouped together primarily because of the contaminants released and hence are not necessarily in geographical proximity. Source area ST10 includes a surface water body (Hardfill Lake) next to a fuel spill area. The primary constituents of concern for human health include benzene, toluene, ethylbenzene, and xylenes (BTEX). Monitored data showed these volatile constituents to be present in groundwater wells. The data also showed an elevated level of trace metals in groundwater.

11231 (WSRC-TR–94-0544) **Plant community development within the F- and H-Area tree-kill zone.** Nelson, E.A.; Westbury, H.M. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005486. Source: OSTI; NTIS; GPO Dep.

The F- and H-Area Seepage Basins received liquid waste from the F and H chemical separation facilities from 1955 through 1988. Tree mortality in seepline fed wetlands down-slope from the basins was observed in the late 1970's, and investigations were conducted to determine the cause and source of the impacts. Analysis of the soil and water in the tree-kill zones demonstrated a strong chemical linkage with the F- and H-Area seepage basins. Although no single cause of the mortality was determined, it was believed to be the result of interactions of alterations in the hydrology and erosional deposition, along with lowering of pH and increased conductivity, sodium, aluminum, and nitrogen compounds. A mild drought during the growing season may also have increased the concentration of the chemical contaminants in the soils matrix. In 1988, the F- and H-Area Seepage Basins were closed and covered with a clay cap to reduce the rate of dispersion of the contaminants in the soil beneath the basins. Subsequent studies of the chemical composition of the tree-kill zone groundwater and toxicological characteristics of the seepline soil have shown a reduced contaminant flux. In 1993, an initial vegetation study was undertaken to determine the level of recovery by the plant communities in the tree-kill zones. This study repeats the initial vegetation investigation in order to further analyze and characterize the recovery of plant communities in the zones after an additional year of growth.

11232 (ETDE-DE–14) **Studies on the generation and reduction of noise from compressed air rotating piston engines under the aspect of energy transformation. Final report.** Quass, M. Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany). Inst. fuer Maschinenwesen. Feb 1990. 138p. (In German).

Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). Contract DFG Ba 854/1-1; Contract DFG Ba 854/1-2. Order Number DE95746739. Source: OSTI; NTIS (US Sales Only).

This thesis deals with possibilities of noise reduction and their influence on performance with the aim of identifying noise reduction measures which do not lead to the so far unavoidable performance cuts. Possible sources of noise from pressurised air piston engines are identified. Based on the analysis of sound excitation the author deals with sound propagation in the engine and the individual elements like rotor, bearing or stator as well as the sound radiation from the housing or components connected to it (protecting metal sheets of grinding machines for instance) and direct sound transmitted by air emitted from machinery into the immediate environment. (orig./HW)

11233 (PNL-SA–24930) **Interaction mechanisms and biological effects of static magnetic fields.** Tenforde, T.S. Pacific Northwest Lab., Richland, WA (United States). Jun 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9406207–2: U.S.-Japan science seminar, Sapporo (Japan), 28 Jun - 1 jul 1994). Order Number DE95004929. Source: OSTI; NTIS; GPO Dep.

Mechanisms through which static magnetic fields interact with living systems are described and illustrated by selected experimental observations. These mechanisms include electrodynamic interactions with moving, ionic charges (blood flow and nerve impulse conduction), magnetomechanical interactions (orientation and translation of molecules structures and magnetic particles), and interactions with electronic spin states in charge transfer reactions (photo-induced electron transfer in photosynthesis). A general summary is also presented of the biological effects of static magnetic fields. There is convincing experimental evidence for magnetoreception mechanisms in several classes of lower organisms, including bacteria and marine organisms. However, in more highly evolved species of animals, there is no evidence that the interactions of static magnetic fields with flux densities up to 2 Tesla (1 Tesla [T] = 10^4 Gauss) produce either behavioral or physiolocical alterations. These results, based on controlled studies with laboratory animals, are consistent with the outcome of recent epidemiological surveys on human populations exposed occupationally to static magnetic fields.

This report present a reviewing of literature about the geophysics and hydrogeologic parameters. The relationship between seismic and hydrological parameters and aquifers properties are presented as well.

11236 (IFE/KR/E–94/007) **The blanketing effect in sedimentary basins.** Wangen, M. Institutt for Energiteknikk, Kjeller (Norway). Dec 1994. 58p. Order Number DE95755138. Source: OSTI; NTIS.

The report deals with the thermal effects of sedimentation, when the sedimentary basin is considered an integral part of the lithosphere. The deposition of cold sediments, called thermal blanketing, is studied. A general one-dimensional temperature equation is obtained which accounts for blanketing, the movement of the lower boundary of the lithosphere, and the eventual stretching of the lithosphere. This equation is made dimensionless, and then studied in two different settings; one where the lithosphere remains unstretched, and another where the lithosphere is subjected to constant strain rate stretching. The parameter controlling thermal blanketing in these models is a Peclet number. The transient period towards a stationary state, and the stationary state representing maximal blanketing are studied. General conclusions about the possibilities for blanketing are stated in terms of the Peclet number. 12 refs., 12 figs., 3 tabs.

11237 (SAND–95-0169C) **3-D seismic imaging of complex geologies.** Womble, D.E.; Dosanjh, S.S.; VanDyke, J.P.; Oldfield, R.A.; Greenberg, D.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950439–6: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95006813. Source: OSTI; NTIS; GPO Dep.

We present three codes for the Intel Paragon that address the problem of three-dimensional seismic imaging of complex geologies. The first code models acoustic wave propagation and can be used to generate data sets to calibrate and validate seismic imaging codes. This code reported the fastest timings for acoustic wave propagation codes at a recent SEG (Society of Exploration Geophysicists) meeting. The second code implements a Kirchhoff method for pre-stack depth migration. Development of this code is almost complete, and preliminary results are presented. The third code implements a wave equation approach to seismic migration and is a Paragon implementation of a code from the ARCO Seismic Benchmark Suite.

Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 41p. Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). Contract DFG Gr 1031/2-1. Order Number DE95755646. Source: OSTI; NTIS (US Sales Only); INIS.

A systematic classification of Feynman path integrals in quantum mechanics is presented and a table of solvable path integrals is given which reflects the progress made during the last 15 years, including, of course, the main contributions since the invention of

the path integral by Feynman in 1942. An outline of the general theory is given which will serve as a quick reference for solving path integrals. Explicit formulae for the so-called basic path integrals are presented on which our general scheme to classify and calculate path integrals in quantum mechanics is based. (orig.)

11240 (DESY–94-213) **Spectral statistics in the quantized cardioid billiard.** Baecker, A. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Steiner, F.; Stifter, P. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 21p. Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). Contract DFG-Ste 241/7-1. Order Number DE95755643. Source: OSTI; NTIS (US Sales Only); INIS.

The spectral statistics in the strongly chaotic cardioid billiard are studied. The analysis is based on the first 11000 quantal energy levels for odd and even symmetry respectively. It is found that the level-spacing distribution is in good agreement with the GOE distribution of random-matrix theory. In case of the number variance and rigidity we observe agreement with the random-matrix model for short-range correlations only, whereas for long-range correlations both statistics saturate in agreement with semiclassical expectations. Furthermore the conjecture that for classically chaotic systems the normalized mode fluctuations have a universal Gaussian distribution with unit variance is tested and found to be in very good agreement for both symmetry classes. By means of the Gutzwiller trace formula the trace of the cosine-modulated heat kernel is studied. Since the billiard boundary is focusing there are conjugate points giving rise to zeros at the locations of the periodic orbits instead of exclusively Gaussian peaks. (orig.)

11241 (ENEA-RT-INN–94-26) **Generalized forms of Bessel functions and Hermite polynomials.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Torre, A.; Lorenzutta, S.; Maino, G. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jun 1994. 41p. (RT/INN–94-26). Order Number DE95749667. Source: OSTI; NTIS (US Sales Only).

Generalized Bessel functions are receiving increasing attention from both the purely mathematical and the applicative points of view. They have, indeed, been shown to be intimately linked to the theory of Jacobi and Weierstrass elliptic functions and offered, in simple and elegant terms, the solutions of problems in electromagnetism, hardly achievable with conventional means. Hermite polynomials with many variables and many indices were originally introduced by Hermite himself. However, unlike the ordinary case, they did not find significant applications and are, therefore, scarcely known to non-mathematicians. Recent developments of phase-space classical and quantum mechanics demand the use of this class of orthogonal polynomial and for the associated orthornormal functions. The theory of generalized Bessel functions and generalized Hermite polynomials from a unified point of view are discussed. New addition and multiplication theorems for the multivariable Bessel functions as well as the set of partial differential equations they satisfy are presented. As to the Hermite polynomials, the relevant formalism is discussed and the generalised harmonic oscillator functions along with the relevant creation and annihilation operators are introduced. Some comments on the applications are also presented.

11242 (ENEA-RT-INN–94-27) **Quantistic perturbative methods applied to classical mechanics.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Torre, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 26p. (In Italian). (RT/INN–94-27). Order Number DE95749696. Source: OSTI; NTIS (US Sales Only).

It is analyzed the possibility of applying to classical mechanics perturbative methods, developed within the framework of quantum mechanics, such as the Feynman-Dyson methods. In this connection, the concept of phase-space, basic to the Hamiltonian formalism of classical mechanics, plays a crucial role, providing the formal apparatus for a unifying view to classical and quantum mechanics.

11243 (IPNO-TH–94-11) **Haldane's fractional statistics and the Riemann-Roch theorem.** Dingping Li (International School of Advanced Studies, Trieste (Italy)); Ouvry, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Mar 1994. 18p. (SISSA–27/94-EP-UTF-324.). Order Number DE95620493. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Physics B (NL).

The new definition of fractional statistics given by Haldane can be understood in some special cases in terms of the Riemann-Roch theorem. (authors). 25 refs.

11244 (IPNO-TH–94-19) **Tunneling and the band structure of chaotic systems.** Leboeuf, P.; Mouchet, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Apr 1994. 12p. Order Number DE95619167. Source: OSTI; NTIS (US Sales Only); INIS.

The dispersion laws of chaotic periodic systems are computed using the semiclassical periodic orbit theory to approximate the trace of the powers of the evolution operator. Aside from the usual real trajectories, complex orbits are also included. These turn out to be fundamental for a proper description of the band structure since they incorporate conduction processes through tunneling mechanisms. The results obtained, illustrated with the kicked-Harper model, are in excellent agreement with numerical simulations, even in the extreme quantum regime. (authors). 14 refs., 1 fig.

11245 (IPNO-TH–94-20) **Single-particle density of states for the Aharonov-Bohm potential and the instability of matter with anomalous magnetic moment in 2+1 dimensions.** Moroz, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Apr 1994. 11p. Order Number DE95619168. Source: OSTI; NTIS (US Sales Only); INIS.

In the nonrelativistic case it has been found that whenever the relation $mc^2/e^2 < X(\alpha,g_m)$ is satisfied, where α is a flux, g_m is magnetic moment, and $X(\alpha,g_m)$ is some function that is nonzero only for $g_m>2$, then the matter is unstable against formation of the flux α. The result persists down to $g_m=2$ provided the Aharonov-Bohm potential is supplemented with a short range attractive potential. The results are obtained by calculating the change of the density of states induced by the Aharonov-Bohm potential. The Krein-Friedel formula for this long-ranged potential is shown to be valid when supplemented with zeta function regularization. (author). 23 refs.

A general covariant analog of the standard non-relativistic Quantum Mechanics with relativistic corrections in normal geodesic frames in the general Riemannian space-time is constructed for the Dirac particle. Not only the Pauli equation with hermitian Hamiltonian and the pre-Hilbert structure of space of its solutions but also the matrix elements of hermitian operators of momentum, (curvilinear) spatial coordinates and spin of the particle are deduced as general-covariant asymptotic approximation in c^{-2}, c being the velocity of light, to their naturally determined general-relativistic pre images. It is shown that the Hamiltonian in the Pauli equation originated by the Dirac equation is unitary equivalent to the operator of energy, originated by the metric energy-momentum tensor of the spinor field. Commutation and other properties of the observables connected with the considered change of geometrical background of Quantum Mechanics are briefly discussed. 7 refs.

11249 (JINR-R–2-94-226) **The Method of Integration of the Nonlinear Schroedinger Equation with a Source.** Mel'nikov, V.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 30p. (In Russian). Order Number DE95623601. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Bulletin of the Technical University of Istanbul.

It is shown that the nonlinear Schroedinger equation with a source can be investigated by the inverse scattering method for the Dirac operator if the source is represented as the Fourier integral over the eigenfunctions of the so-called generating operator. The conditions are found under which the nonlinear Schroedinger equation with a source has a pure soliton solution. The obtained results are relevant to some problems of plasma physics and solid state physics. 12 refs.

11250 (JINR-R–4-94-335) **Transparent Potential Perturbations on Lattices and in the Periodical Structures. Elements of the Qualitative Theory of Wave Motion Over the Channels.** Zakhar'ev, B.N.; Pashnev, A.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 11p. (In Russian). Order Number DE95623602. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the peculiarities of the wave motion over the discrete variable 'n' do not permit to construct the local potential v(n) transparent for all energies of the allowed zone. Every local potential well bends the allowed zone in the plane 'E, n' and necessitates the lowering of its upper boundary (the appearance of the effective barrier hanging from above) what gives strong reflection of waves. To remove the hindering prominence of the forbidden zone into the allowed one it is possible to use the minimal nonlocality: the potential u(n) on the neighbour diagonals of the matrix finite-difference Hamiltonian. Together the soliton-like potentials constitute the reflectionless system. Different transparent systems are demonstrated by means of instructive illustrations. In the periodical potentials the matching conditions of functions on the neighbour intervals (periods) play the part of minimal nonlocality. (author). 31 refs., 6 figs.

11251 (LA-UR–94-4385) **The hard truth.** Hanson, K.M.; Cunningham, C.S. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9408207–1: Maximum entropy and Bayesian methods, Cambridge (United Kingdom), 1-4 Aug 1994). Order Number DE95005240. Source: OSTI; NTIS; GPO Dep.

In the Bayesian methodology, the posterior probability combines uncertainty about prior knowledge, and available data about alternative models of reality. The posterior quantifies the degree of certainty one has in inferring the truth in terms of those models. We propose a method to determine the reliability of a specific feature of a Bayesian solution. Our approach is based on an analogy between the negative logarithm of the posterior and a physical potential. This analogy leads to the interpretation of gradient of this potential as a force that acts on the model. As model parameters are perturbed from their maximum a posteriori (MAP) values, the strength of the restoring force that drives them back to the MAP solution is directly related to the reliability of those parameter estimates. The correlations between the uncertainties of parameter estimates can be elucidated.

11252 (SLAC-PUB–95-6750) **Measurement accuracy, bit-strings, Manthey's quaternions, and RRQM.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409283–1: 16. annual international meeting of the Alternative Natural Philosophy Association, Cambridge (United Kingdom), 10-13 Sep 1994). Order Number DE95006211. Source: OSTI; NTIS; INIS; GPO Dep.

The author continues the discussion started last year. By now three potentially divergent research programs have surfaced in ANPA: (1) the Bastin-Kilmister understanding of the combinatorial hierarchy (Clive's "Menshevik" position); (2) the author's bit-string "Theory of Everything" (which Clive has dubbed "Bolshevik"); (3) Manthey's cycle hierarchy based on co-occurrence and mutual exclusion that Clive helped him map onto quaternions (as an yet unnamed heresy?). Unless a common objective can be found, these three points of view will continue to diverge. The authors suggests the reconstruction of relativistic quantum mechanism (RRQM) as a reasonable, and attainable, goal that might aid convergence rather than divergence.

11253 (UWThPh–1993-40) **Clustering for algebraic K-systems.** Narnhofer, H.; Thirring, W. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 10 Nov 1993. 10p. Order Number DE95623603. Source: OSTI; NTIS (US Sales Only); INIS.

We prove that for a von Neumann algebra that is an algebraic K system with respect to some automorphisms, the invariant state is K-clustering and r-clustering. Further we study in examples how far the Neumann algebra inherits the K property from the underlying C* algebra. (authors).

11254 (UWThPh–1993-57) **Strong clustering in type III entropic K-systems.** Benatti, F. (Dipartimento di Fisica Teorica, Strada Costiera 11, I-34014 Trieste (Italy)); Narnhofer, H. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1993. 31p. (ESI–104-1994.). Order Number DE95623604. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that automorphisms of some factors of type III_λ, with $0 < \lambda \leq 1$, corresponding to Kolmogorov quantum dynamical systems of entropic type are strongly clustering. (authors).

From 4. international conference on applications of nuclear techniques: neutrons and their applications; Crete (Greece); 12-18 Jun 1994. Order Number DE95007006. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments important to the future success of the Holifield Radioactive Ion Beam Facility (HRIBF) are in progress at the Oak Ridge National Laboratory which are designed to select the most appropriate target material for generating a particular radioactive ion beam (RIB). The 25-MV HHIRF tandem accelerator is used to implant stable complements of interesting radioactive elements into refractory targets mounted in a high-temperature FEBIAD ion source which is "on-line" at the UNISOR facility. The intensity versus time of implanted species, which diffuse from the high-temperature target material (~1700°C) and are ionized in the FEBIAD ion source, is used to determine release times for a particular projectile/target material combination. From such release data, diffusion coefficients can be derived by fitting the theoretical results obtained by computational solution of Fick's second equation to experimental data. The diffusion coefficient can be used subsequently to predict the release properties of the particular element from the same material in other target geometries and at other temperatures, provided that the activation energy is also known. Diffusion coefficients for Cl implanted into and diffused from CeS and Zr_5Si_3 and As, Br, and Se implanted into and diffused from Zr_5Ge_3 have been derived from the resulting intensity versus time profiles. Brief descriptions of the experimental apparatus and procedures utilized in the present experiments and plans for future related experiments are presented.

11256 (ENEA-RT-INN–94-30) **Betraton motion and linear undulator brightness: Inhomogeneous broadening effects due to e-beam emittance and Twiss parameters.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Voykov, G.K.; Carpanese, M. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Sep 1994. 32p. (RT/INN–94-30). Order Number DE95749663. Source: OSTI; NTIS (US Sales Only).

The combined effects of e-beam betatron motion and non-negligible emittance provide a richer phenomenology of the radiation emitted in linearly polarized undulators. Indeed, even harmonics may be radiated on axis and the induced inhomogeneous broadenings depend on the e-beam matching condition. The report discusses the dependence of undulator brightness on e-beam betatron motion and also analyzes how the harmonic spectrum depends on the e-beam emittance and Twiss parameters. The report presents independent analytical and numerical analyses, making a comparison between the two methods, and comments on the limits of the analytical treatment.

11257 (ENEA-RT-INN–94-48) **Electron beam propagation in linearly polarized undulators: Effect of anharmonicity on spatial and phase-space distributions.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Ottaviani, P.L. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Mar 1994. 38p. (RT/INN–94-48). Order Number DE95749715. Source: OSTI; NTIS (US Sales Only).

The betatron part of the equations of motion of an electron beam, propagating in a linearly polarized undulator, can be derived from a quartic anharmonic oscillator Hamiltonian coupling the vertical and radial components. It's solved the relevant Liouville equation, providing the evolution of the e-beam phase-space distribution, and the variation, during the transport, of quantities of physical interest. In particular radial and vertical phase-space contour plots which exhibit distortions, due to non linear effects, and consequent emittance growth are discussed. The integration method employed is based on a symmetric split under study. Previous results from a macroparticle simulation are used as bench-mark. Finally is shown that the split operator technique naturally leads to area preserving maps.

11260 (BNL–61120) **Update of GALLEX solar neutrino results and implications.** Kirsten, T. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany)). Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States);Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Krupp von Bohlen und Halbach-Stiftung, Essen (Germany);Istituto Nazionale di Fisica Nucleare, Rome (Italy);CEA, 75 - Paris (France). DOE Contract AC02-76CH00016. (CONF-9405216–3: Neutrino '94: 16th international conference on neutrino physics and astrophysics, Eilat (Israel), 29 May - 3 jun 1994). Order Number DE95005005. Source: OSTI; NTIS; INIS; GPO Dep.

The galliumchloride detector operated by the GALLEX-collaboration in the Gran Sasso Underground Laboratory responds primarily to pp-neutrinos. They are produced in the primary fusion reaction of hydrogen into deuterium and directly coupled to the solar luminosity. Standard Solar Models predict ca. 58% of the total signal expected in GALLEX (123-132 SNU) to be due to pp-neutrinos. The relative pp-neutrino dominance becomes even larger if the deficit of higher energy neutrinos (as observed in the Homestake- and Kamiokande experiments) is considered. During the first data taking period, 15 solar runs had been performed within the exposure period 14.5.1991 - 29.4.1992. The result, 81 $\pm$ 17 $\pm$ 9 SNU provided the first experimental evidence for pp-neutrinos from the Sun. At the same time, it confirmed the depression of higher energy neutrino fluxes relative to the model predictions. Here the authors report the results of 15 more solar neutrino runs, covering the period 19.8.92 - 13.10.93. They obtain 78 $\pm$ 13 $\pm$ 5 SNU. Evaluated together, the result for all 30 runs is 79 $\pm$ 10 $\pm$ 6 SNU. While the SNU rate of GALLEX I is well reproduced the statistical error has been reduced so substantially that a value of signal $+2\sigma$ is required to accommodate not only pp-and pep- but also the ^{7}Be-neutrino induced ^{71}Ge-production. Contrary, the fate of ^{8}B-neutrinos has only little discernible effect on the GALLEX data. In conclusion, with the present errors GALLEX constitutes a 2.5 σ problem for ^{7}Be neutrinos within the frame of "astrophysical" solutions. Alternatively, the particle physics solution (MSW-effect) can consistently explain all available solar neutrino results, leading to a most probable mass scale with the muon-neutrino at approximately 3 meV (milli-eV). However, since the GALLEX result allows the presence of pp and pep neutrinos at full strength. the latter explanation of the data is not forced.

11261 (DESY–94-199) **The Geroch group in the Ashtekar formulation.** Mizoguchi, Shun'ya (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 41p. Order Number DE95755645. Source: OSTI; NTIS (US Sales Only).

We study the Geroch group in the framework of the Ashtekar formulation. In the case of the one-Killing-vector reduction, it turns out that the third column of the Ashtekar connection is essentially the gradient of the Ernst potential, which implies that the both quantities are based on the "same" complexification. In the two-Killing-vector reduction, we demonstrate Ehlers' and Matzner-Misner's SL(2,R) symmetries, respectively, by constructing two sets of canonical variables that realize either of the symmetries canonically, in terms of the Ashtekar variables. The conserved charges associated with these symmetries are explicitly obtained. We show that the gl(2,R) loop algebra constructed previously in the loop representation is not the Lie algebra of the Geroch group itself. We also point out that the recent argument on the equivalence to a chiral model is based on a gauge-choice which cannot be achieved generically. (orig.)

11262 (DOE/ER/40452–11) **Detection of charged particles in superfluid helium.** Bandler, S.R. Brown Univ., Providence, RI (United States). Dept. of Physics. Dec 1994. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40452. Order Number DE95007354. Source: OSTI; NTIS; INIS; GPO Dep.

This thesis is concerned with the use of a large superfluid helium detector for the detection of solar neutrinos. A small-scale prototype of this type of detector has been constructed and tested. In this thesis the author discussed in detail the design of the apparatus, the experiments which have been carried out, and what has been learned about the important physical processes involved in

this type of detector. These processes include the anisotropic generation of phonons and rotons by the recoiling particle, the propagation of the phonons and rotons in the liquid, the evaporation process at the liquid surface, and the adsorption of the helium atoms onto the wafers. In addition he discusses the generation and detection of fluorescent photons from recoiling particles. The implications of these results to the design of a full-scale detector of neutrinos are discussed.

11263 (DOE/ER/40561–179) **Magnetization of ferromagnetic clusters.** Onishi, Naoki (Univ. of Tokyo (Japan). Inst. of Physics); Bertsch, G.; Yabana, Kazuhiro. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE95006878. Source: OSTI; NTIS; INIS; GPO Dep.

The magnetization and deflection profiles of magnetic clusters in a Stern-Gerlach magnet are calculated for conditions under which the magnetic moment is fixed in the intrinsic frame of the cluster, and the clusters enter the magnetic field adiabatically. The predicted magnetization is monotonic in the Langevin parameter, the ratio of magnetic energy $\mu_0 B$ to thermal energy $k_B T$. In low field the average magnetization is 2/3 of the Langevin function. The high-field moment approaches saturation asymptotically as $B^{-1/2}$ instead of the B^{-1} dependence in the Langevin function.

11264 (DOE/ET/53088–684) **Magnetic viscosity by localized shear flow instability in magnetized accretion disks.** Matsumoto, R.; Tajima, T. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Jan 1995. 45p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–684). Order Number DE95006879. Source: OSTI; NTIS; INIS; GPO Dep.

Differentially rotating disks are subject to the axisymmetric instability for perfectly conducting plasma in the presence of poloidal magnetic fields. For nonaxisymmetric perturbations, the authors find localized unstable eigenmodes whose eigenfunction is confined between two Alfven singularities at $\omega_d = \pm \omega_A$, where ω_d is the Doppler-shifted wave frequency, and $\omega_A = k||v_A$ is the Alfven frequency. The radial width of the unstable eigenfunction is $\Delta x \sim \omega_A/(Ak_y)$, where A is the Oort's constant, and k_y is the azimuthal wave number. The growth rate of the fundamental mode is larger for smaller value of k_y/k_z. The maximum growth rate when $k_y/k_z \sim 0.1$ is $\sim 0.2\Omega$ for the Keplerian disk with local angular velocity Ω. It is found that the purely growing mode disappears when $k_y/k_z > 0.12$. In a perfectly conducting disk, the instability grows even when the seed magnetic field is infinitesimal. Inclusion of the resistivity, however, leads to the appearance of an instability threshold. When the resistivity η depends on the instability-induced turbulent magnetic fields δB as $\eta([\delta B^2])$, the marginal stability condition self-consistently determines the α parameter of the angular momentum transport due to the magnetic stress. For fully ionized disks, the magnetic viscosity parameter α_B is between 0.001 and 1. The authors' three-dimensional MHD simulation confirms these unstable eigenmodes. It also shows that the α parameter observed in simulation is between 0.01 and 1, in agreement with theory. The observationally required smaller α in the quiescent phase of accretion disks in dwarf novae may be explained by the decreased ionization due to the temperature drop.

11265 (ETDE-IT–95-06) **Betatron motion and linear undulator brightness: Inhomogeneous broadening effects due to e-beam emittance and Twiss parameters.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Voykov, G.K.; Carpanese, M. ENEA, Frascati (Italy). 1994. 40p. Order Number DE95749700. Source: OSTI; NTIS (US Sales Only).

The combined effects of e-beam betatron motion and non-negligible emittance provide a richer phenomenology of the radiation emitted in linearly polarized undulators. Indeed, even harmonics may be radiated on axis and the induced inhomogeneous broadenings depend on the e-beam matching condition. It is discussed the dependence on undulator brightness on e-beam betatron motion and also analyzed how the harmonic spectrum depends on the e-beam emittance and Twiss parameters. In this report are presented the independent analytical and numerical analyses, a comparison between the two methods, and it is commented on the limits of the analytical treatment.

11266 (INIS-mf–14468) **Fractals in Power Reactor Noise.** Aguilar Martinez, O. (Centro de Informacion de la Energia Nuclear, La Habana (Cuba)). Centro de Informacion de la Energia Nuclear, La Habana (Cuba). 1994. 10p. (In Spanish). (CONF-9407164–: Workshop on non-lineal dynamic systems, Havana (Cuba), 18-19 Jul 1994). Order Number DE95619189. Source: OSTI; NTIS (US Sales Only); INIS.

In this work the non- lineal dynamic problem of power reactor is analyzed using classic concepts of fractal analysis as: attractors, Hausdorff-Besikovics dimension, phase space, etc. A new non-linear problem is also analyzed: the discrimination of chaotic signals from random neutron noise signals and processing for diagnosis purposes. The advantages of a fractal analysis approach in the power reactor noise are commented in details.

11267 (JINR–94-55) **Bogolyubov lectures.** Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 215p. (In English, Russian). (CONF-9308260–: International Bogolyubov memorial meeting, Dubna (Russian Federation), 19-21 Aug 1993). Order Number DE95620495. Source: OSTI; NTIS (US Sales Only); INIS.

The papers of the International Bogolyubov Memorial Meeting at Dubna in August 19-21, 1993 are given. The meeting pays special attention to problems of kinetic theory, polaron theory, multiparticle distribution functions in problems of statistical mechanics and other aspects of modern physics.

11268 (JINR–94-55, pp. 5-32) **Bogolubov and kinetic theory: the Bogolubov equations.** Cohen, E.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 215p. (CONF-9308260–: International Bogolyubov memorial meeting, Dubna (Russian Federation), 19-21 Aug 1993). In *Bogolyubov reading.* Order Number DE95620495. Source: OSTI; NTIS (US Sales Only); INIS.

Bogolyubov's dynamical theory of statistical physics as applied to gases with short-range interparticle forces leading to a formal generalization of the Boltzmann equation to all orders in the density is discussed. The divergences of the higher order terms in the newly derived equation are analyzed. 27 refs., 4 figs., 2 tabs.

11269 (JINR–94-55, pp. 121-124) **Accelerated convergence and calculation of the radial distribution function of a hard sphere system.** Bazarov, I.P. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation)); Nikolaev, P.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 215p. (In Russian). (CONF-9308260–: International Bogolyubov memorial meeting, Dubna (Russian Federation), 19-21 Aug 1993). In *Bogolyubov reading.* Order Number DE95620495. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of calculation of a radial distribution function of a hard-sphere system is discussed. The radial distribution function exactly reproducing all known virial coefficients in the framework of the perturbation theory is obtained. 4 refs.

11270 (JINR-D–2-94-331) **The 'Problem 4/3' as a Consequence of Contracted Length Non-Covariance.** Strel'tsov, V.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 3p. Order Number DE95623628. Source: OSTI; NTIS (US Sales Only); INIS.

It is emphasized that the known non-covariance of the energy and the momentum of the electromagnetic field of a moving charge is a direct consequence of the generally accepted definition of dimensions of moving objects. As known, according to this definition the longitudinal sizes contract. 8 refs.

11271 (JINR-E–3-93-61, pp. 79-82) **Energy spectra of low-energy heavy nuclei inside the Earthe's magnetosphere on the orbital stations.** Gaparin, Yu.F. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. (CONF-9203318–: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In 2.

International Workshop Solid State Nuclear Track Detectors and their Applications. 205p. Order Number DE95620429. Source: OSTI; NTIS (US Sales Only); INIS.

New data on energy spectra of light and heavy nuclei at energy os 10-200 inside the Earth's magnetosphere are reported.

11272 (LA-UR–94-3033) **Views of the solar system.** Hamilton, C. Los Alamos National Lab., NM (United States). [1995]. 199p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006446. Source: OSTI; NTIS; GPO Dep.

Views of the Solar System has been created as an educational tour of the solar system. It contains images and information about the Sun, planets, moons, asteroids and comets found within the solar system. The image processing for many of the images was done by the author. This tour uses hypertext to allow space travel by simply clicking on a desired planet. This causes information and images about the planet to appear on screen. While on a planet page, hyperlinks travel to pages about the moons and other relevant available resources. Unusual terms are linked to and defined in the Glossary page. Statistical information of the planets and satellites can be browsed through lists sorted by name, radius and distance. History of Space Exploration contains information about rocket history, early astronauts, space missions, spacecraft and detailed chronology tables of space exploration. The Table of Contents page has links to all of the various pages within Views Of the Solar System.

11273 (LA-UR–94-4163) **Rich cluster simulation: Dynamics and mass estimates.** Bromley, B. (Los Alamos National Lab., NM (United States)); Warren, M.; Zurek, W.; Quinn, P.J. Los Alamos National Lab., NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410287–1: 5. astrophysics conference: dark matter, College Park, MD (United States), 10-12 Oct 1994). Order Number DE95005233. Source: OSTI; NTIS; GPO Dep.

We present an analysis of a simulated rich cluster dominated by cold dark matter. Here, we focus on the dynamics of collapsed dark matter halos which may be associated with galaxies. We use projected positions and velocities of both dark matter particles and of halos to assess several conventional measures of cluster mass. The results indicate that the measures give reasonable results for dark matter particles but cause overestimates when applied to halos. In searching for the source of the discrepancies, we find that tidal disruption and dynamical friction do not induce a significant bias in the projected velocity dispersion of halos; however, an antibias in the spatial distribution of halos relative to that of the total mass appears to be most problematic for cluster mass estimates.

11274 (LA-UR–94-4268) **The second coming of cold dark matter?.** Zurek, W.H.; Bromley, B.C.; Warren, M.S. Los Alamos National Lab., NM (United States). [1994]. 11p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410287–2: 5. astrophysics conference: dark matter, College Park, MD (United States), 10-12 Oct 1994). Order Number DE95005156. Source: OSTI; NTIS; GPO Dep.

While the standard cold dark matter (CDM) model has received numerous marks against it on the basis of a variety of observational data, the prediction of high ΣY, the pairwise-velocity dispersion between galaxies, on small (megaparsec) scales was reported as perhaps one of its greatest failings. Here, we reexamine the case of CDM and ΣY, with high-resolution numerical simulations. The statistic was measured in simulations, in artificial galaxy catalogs, and in the CfA North Forty redshift survey. In our reanalysis of the CfA data, we found that $\Sigma Y \sim 500$ km/s, significantly higher than the original estimates of Davis & Peebles (1983). This new value, along with our estimate of the velocity bias, leads to a virial measure of the cosmological density parameter, $\Omega \sim 0.9$. which is more than four times the traditionally cited CfA result. Analysis the simulations indicates that while the method of Davis and Peebles works well, the ΣY statistic itself is not generally robust: there is large scatter from catalog to catalog and evidence that the recovered ΣY value depends strongly on a small fraction of galaxies in the central regions of rare, massive clusters. Thus, at present the CDM model cannot be deemed incompatible with observed small-scale peculiar velocities.

11275 (LA-UR–94-4361) **Milagro: A low energy threshold extensive air shower array.** Sinnis, C. Los Alamos National Lab., NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409284–1: Trends in astrophysics, Stockholm (Sweden), 22-25 Sep 1994). Order Number DE95005246. Source: OSTI; NTIS; GPO Dep.

Observations of high-energy gamma rays from astronomical sources have revolutionized our view of the cosmos. Gamma rays with energies up to ~10 GeV can be observed directly with space-based instruments. Above 100 GeV the low flux of gamma rays requires one to utilize ground-based instruments. Milagro is a new type of gamma-ray detector based on water Cerenkov technology. This new design will enable to continuously observe the entire overhead sky, and be sensitive to cosmic rays with energies above ~250 GeV. These attributes make Milagro an ideal detector for the study of high-energy transient phenomenon.

11276 (LA-UR–95-32) **Low energy neutral atom imaging: Remote observations of the magnetosphere.** Funsten, H.O.; McComas, D.J.; Scime, E.E.; Moore, K.R. Los Alamos National Lab., NM (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950130–8: 33. American Institute of Aeronautics and Astronautics (AIAA) aerospace sciences meeting, Reno, NV (United States), 9-12 Jan 1995). Order Number DE95006342. Source: OSTI; NTIS; GPO Dep.

Recent developments in detection of neutral atom imaging should enable imaging the global structure and dynamics of the terrestrial magnetosphere. The inherent technical challenge of imaging low energy neutral atoms (LENAs) with energy < 30 keV is their separation from the tremendous UV background, to which LENA detectors are sensitive, without loss of information of LENA trajectory and energy. Three instrument concepts for separating LENAs from the background UV are presented: LENA charge conversion via transmission through an ultrathin carbon foil and subsequent electrostatic deflection, EUV grating polarizers and attenuators, and high frequency shutters. Each of these concepts can be mated to a detector section that provides both LENA imaging capability and coincidence/time-of-flight.

11277 (LA-UR–95-413) **Classification of RF transients in space using digital signal processing and neural network techniques.** Moore, K.R.; Blain, P.C.; Briles, S.D.; Jones, R.G. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950472–1: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95006287. Source: OSTI; NTIS; GPO Dep.

The FORTE′ (Fast On-Orbit Recording of Transient Events) small satellite experiment scheduled for launch in October, 1995 will attempt to measure and classify electromagnetic transients as sensed from space. The FORTE′ payload will employ an Event Classifier to perform onboard classification of radio frequency transients from terrestrial sources such as lightning. These transients are often dominated by a constantly changing assortment of man-made "clutter" such as TV, FM, and radar signals. The FORTE′ Event Classifier, or EC, uses specialized hardware to implement various signal processing and neural network algorithms. The resulting system can process and classify digitized records of several thousand samples onboard the spacecraft at rates of about a second per record. In addition to reducing dowlink rates, the EC minimizes command uplink data by normally using uploaded algorithm sequences rather than full code modules (although it is possible for full code modules to be uploaded from the ground). The FORTE′ Event Classifier experiment combines science and engineering in an evolutionary step toward useful and robust adaptive processing systems in space.

11278 (LA-UR–95-553) **Relativistic electrons in the outer-zone: An 11 year cycle, their relation to the solar wind.** Belian, R.D. (Los Alamos National Lab., NM (United States)); Cayton,

T.E.; Christensen, R.A.; Ingraham, J.C.; Meier, M.M.; Reeves, G.D.; Lazarus, A.J. Los Alamos National Lab., NM (United States). [1994]. 15p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9408182–4: 10. Taos workshop on the earth's trapped particle environment, Taos, NM (United States), Aug 1994). Order Number DE95007882. Source: OSTI; NTIS; GPO Dep.

We examine Los Alamos energetic electron data from 1979 through the present to show long term trends in the trapped relativistic electron populations at geosynchronous-earth-orbit (GEO). Data is examined from several CPA and SOPA instruments to cover the interval from 1979 through June 1994. It is shown that the higher energy electrons fluxes ($E > 300$ keV) displayed a cycle of ≈11 years. In agreement with other investigators, we also show that the relativistic electron cycle is out of phase with the sunspot cycle. We compare the occurrences of relativistic electrons and solar wind high speed streams and determine that on the time scale of 15 years the two do not correlate well. The long-term data set we provide here shows a systematic change of the electron energy spectrum during the course of the solar cycle. This information should be useful to magnetospheric scientists, model designers and space flight planners.

11279 (SAND–95-0035C) **New paradigms for the statistics profession.** Iman, R.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9408107–5: American Statistical Association, Toronto (Canada), 14-18 Aug 1994). Order Number DE95006470. Source: OSTI; NTIS; GPO Dep.

This paper is a presentation made in support of the statistics profession. This field can say it has had a major impact in most major fields of study presently undertaken by man, yet it is not perceived as an important, or critical field of study. It is not a growth field either, witness the almost level number of faculty and new PhD's produced over the past twenty years. The author argues the profession must do a better job of selling itself to the students it educates. Awaken them to the impact of statistics in their lives and their business worlds, so that they see beyond the formulae to the application of these principles.

11280 (SAND–95-0093C) **Phase correction in two-crystal optical parametric oscillators.** Armstron, D.J.; Alford, W.J.; Raymond, T.D.; Smith, A.V. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–5: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006317. Source: OSTI; NTIS; GPO Dep.

The effect of the pump, signal, and idler wave phases on three-wave nonlinear parametric mixing is investigated in a series of single-pass-gain experiments. Measurements are made with two angle-tuned KTP crystals in a 532 nm pumped, walkoff-compensated, optical parametric amplifier that is seeded by an 800 nm cw diode laser. In one of the measurements the second crystal is orientated to have its effective nonlinearity $d_{eff.}$ of opposite sign to that of the first crystal, so that all mixing that occurred in the first crystal is cancelled by the second when the phase mismatch $\Delta k_{crystal1} = \Delta k_{crystal2} = 0$. Efficient two-crystal amplification is subsequently restored by selecting the correct phase relationship for the three waves entering the crystal by inserting a dispersive plate between the crystals. The experimental results are explained in a straightforward manner with diagrams involving the three input wave polarizations. These results demonstrate that walkoff-compensated geometries require phase correction to achieve efficient mixing in the second crystal whenever the nonlinear interaction involves two extraordinary waves (e-waves). One practical application of this work may be lower oscillation thresholds and enhanced performance in walkoff-compensated optical parametric oscillators which use two e-waves.

11281 (UCRL-JC–116569) **Viscoelastic waves and multiple scales.** Hedstrom, G. Lawrence Livermore National Lab., CA (United States). May 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950413–1: 3. international conference on mathematical and numerical aspects of wave propagation phenomena, Juan-les-Pins (France), 24-28 Apr 1995). Order Number DE94014130. Source: OSTI; NTIS; GPO Dep.

A multiple-scales argument is used to obtain the speeds of the main shear and compressional waves in a general homogeneous viscoelastic medium. The rate of spreading by diffusion of these waves is also derived. These methods are also used to determine the speed of the main viscoelastic Rayleigh wave, as well as the rate of its energy decay.

11282 (UCRL-JC–119288) **Laboratory high-energy astrophysics on lasers.** Goldstein, W.H.; Liedahl, D.A.; Walling, R.S.; Foord, M.E.; Osterheld, A.L.; Wilson, B.G. Lawrence Livermore National Lab., CA (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409226–5: ECLIM 23: laser interaction with matter, Oxford (United Kingdom), 19-23 Sep 1994). Order Number DE95008062. Source: OSTI; NTIS; GPO Dep.

The tremendous range of temperatures and densities spanned by astrophysical plasmas has significant overlap with conditions attainable using high-power laser facilities. These facilities provide an opportunity to create, control, and characterize plasmas in the laboratory that mirror conditions in some of the most important cosmological systems. Moreover, laboratory experiments can enhance astrophysical understanding by focusing on and isolating important physical processes, without necessarily reproducing the exact conditions of the integral system. Basic study of radiative properties, transport phenomena, thermodynamic response and hydrodynamic evolution in plasmas under properly scaled conditions leads both directly and indirectly to improved models of complex astrophysical systems. In this paper, we will discuss opportunities for current and planned highpower lasers to contribute to the study of high-energy astrophysics.

11283 (UM-P–93/85) **Doppleron resonances in the diffraction of atoms by an evanescent field.** Murphy, J.E. (Melbourne Univ., Parkville, VIC (Australia). School of Physics); Hollenberg, L.C.L.; Smith, A.E. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 16p. Order Number DE95619190. Source: OSTI; NTIS (US Sales Only); INIS.

The diffracted intensities of sodium atoms by a standing evanescent light wave near the three doppleron resonance are calculated using a multi-slice technique. This calculation predicts a sharp dip in the reflected intensity of the specular beam for a detuning slightly below resonance. Such phenomena has been observed experimentally and can be understood using the dressed state picture. 4 refs., 2 tabs., 3 figs.

11284 (DESY–94-146) **Low energy effective actions with composite fields.** Grabowski, M. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany); Hamburg Univ. (Germany). Fachbereich 12 - Physik. Aug 1994. 87p. Order Number DE95746152. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate a Wilson real space renormalization gorup approach for theories in which composite fields are needed at low energies. It furnishes a sequence of effective actions S_Λ which depend on an UV cut-off Λ. We adopt Wilsons fundamental postulate that these effective actions should be local. This is our basic guiding principle on how to construct "blockspins", i.e. the fields which appear in the effective actions. Given a fundamental high energy theory which does not contain composite fields we gradually integrate out high frequency modes in order to lower the cut-off Λ. Eventually appearing nonlocalities at some cut-off value Λ_c indicate

the necessity to introduce new composite degrees of freedom into the theory. An analysis based on Symanzik's infinite set of Bethe-Salpeter equations for all n-point functions shows that a local low energy effective action containing composite fields can be constructed at the compositeness scale Λ_c. Further integration of high frequency modes generates new nonlocalities which can be absorbed into the composite degrees of freedom. There are indications from an 1/N expansion that this suffices already to eliminate high energy degrees of freedom from the composite field so that no separate integration is needed to achieve this. In general the composite field will have self interactions. (orig.)

11285 (DESY–94-158) **How many N = 4 strings exist?.** Ketov, S.V. (Hannover Univ. (Germany). Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 33p. (ITP-UH–13/94; HEP-TH–9409020). Order Number DE95745903. Source: OSTI; NTIS (US Sales Only); INIS.

Possible ways of constructing extended fermionic strings with N=4 world-sheet supersymmetry are reviewed. String theory constraints form, in general, a non-linear quasi(super)conformal algebra, and can have conformal dimensions $\geq$1. When N=4, the most general N=4 quasi-superconformal algebra to consider for string theory building is D(1, 2; α), whose linearisation is the so-called "large" N=4 superconformal algebra. The D(1, 2; α) algebra has su(2)sub(κ^+)+su(2)sub(κ^-)+u(1) Kac-Moody component, and $\alpha=\kappa^-/\kappa^+$. We check the Jacobi identities and construct a BRST charge for the D(1, 2; α) algebra. The quantum BRST operator can be made nilpotent only when $\kappa^+=\kappa^-=-2$. The D(1, 2; 1) algebra is actually isomorphic to the SO(4)-based Bershadsky-Knizhnik nonlinear quasi-superconformal algebra. We argue about the existence of a string theory associated with the latter, and propose the (non-covariant) hamiltonian action for this new N=4 string theory. Our results imply the existence of two different N=4 fermionic string theories: the old one based on the "small" linear N=4 superconformal algebra and having the total ghost central charge c_{gh}=+12, and the new one with non-linearly realised N=4 supersymmetry, based on the SO(4) quasi-superconformal algebra and having c_{gh}=+6. Both critical string theories have negative "critical dimensions" and do not admit unitary matter representations. (orig.)

11286 (DESY–94-159) **Simulating the electroweak phase transition in the SU(2) Higgs model.** Fodor, Z.; Hein, J.; Jansen, K.; Jaster, A.; Montvay, I. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 48p. Order Number DE95746155. Source: OSTI; NTIS (US Sales Only); INIS.

Numerical simulations are performed to study the finite temperature phase transition in the SU(2) Higgs model on the lattice. In the presently investigated range of the Higgs boson mass, below 50 GeV, the phase transition turns out to be of first order and its strength is rapidly decreasing with increasing Higgs boson mass. In order to control the systematic errors, we also perform studies of scaling violations and of finite volume effects. (orig.)

11287 (DESY–94-161) **New examples for Wightman fields on a manifold.** Koehler, M. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 16p. Order Number DE95746151. Source: OSTI; NTIS (US Sales Only); INIS.

The product of two free scalar fields on a manifold is shown to be a well defined operator valued distribution on the GNS Hilbert space of a globally Hadamard product state. Viewed as a new field all n-point distributions exist, giving a new example for a Wightman field on a manifold. (orig.)

11288 (DESY–94-164) **Characterizing invariants for local extensions of current algebras.** Rehren, K.H. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Stanev, Y.S.; Todorov, I.T. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 32p. (ESI–132(1994); HEP-TH–9409165). Order Number DE95745814. Source: OSTI; NTIS (US Sales Only); INIS.

Pairs A contains or equal to B of local quantum field theories are studied, where A is a chiral conformal quantum field theory and B is a local extension, either chiral or two-dimensional. The local correlation functions of fields from B have an expansion with respect to A into conformal blocks, which are non-local in general. Two methods of computing characteristic invariant ratios of structure constants in these expansions are compared: (a) by constructing the monodromy representation of the braid group in the space of solutions of the Knizhnik-Zamolodchikov differential equation, and (b) by an analysis of the local subfactors associated with the extension with methods from operator algebra (Jones theory) and algebraic quantum field theory. Both approaches apply also to the reverse problem: the characterization and (in principle) classification of local extensions of a given theory. (orig.)

11289 (DESY–94-165) **Effects of weak self-interactions in a relativistic plasma on cosmological perturbations.** Nachbagauer, H. (Laboratoire de Physique Theorique ENSLAPP, 74 - Annecy-le-Vieux (France)); Rebhan, A.K.; Schwarz, D.J. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 12p. (ENSLAPP-A–487/94; TUW–94-18; GR-QC–9409055). Order Number DE95746149. Source: OSTI; NTIS (US Sales Only); INIS.

The exact solutions for linear cosmological perturbations which have been obtained for collisionless relativistic matter within thermal field theory are extended to a self-interacting case. The two-loop contributions of scalar $\lambda\phi^4$ theory to the thermal graviton self-energy are evaluated, which give the $O(\lambda)$ corrections in the perturbation equations. The changes are found to be perturbative on scales comparable to or larger than the Hubble horizon, but the determination of the large-time damping behavior of subhorizon perturbations requires a resummation of thermally induced masses. (orig.)

11290 (DESY–94-167) **Duality symmetries and supersymmetry breaking in string compactifications.** Lopes Cardoso, G. (Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik); Luest, D.; Mohaupt, T. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Sep 1994. 13p. (CONF-940722–: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994; HUB-IEP–94/18; HEP-TH–9409095). Order Number DE95746150. Source: OSTI; NTIS (US Sales Only); INIS.

We discuss the spontaneous supersymmetry breaking within the low-energy effective supergravity action of four-dimensional superstrings. In particular, we emphasize the non-universality of the soft supersymmetry breaking parameters, the μ-problem and the duality symmetries. (orig.)

11291 (DESY–94-174) **Conformal Haag-Kastler nets, pointlike localized fields and the existence of operator product expansions.** Fredenhagen, K. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Joerss, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 16p. Order Number DE95745813. Source: OSTI; NTIS (US Sales Only); INIS.

Starting from a chiral conformal Haag-Kastler net on 2 dimensional Minkowski space we construct associated pointlike localized fields. This amounts to a proof of the existence of operator product expansions. We derive the result in two ways. One is based on the geometrical identification of the modular structure, the other depends on a "conformal cluster theorem" of the conformal two-point-functions in algebraic quantum field theory. The existence of the fields then implies important structural properties of the theory, as PCT-invariance, the Bisognano-Wichmann identification of modular operators, Haag duality and additivity. (orig.)

11292 (DESY–94-186) **Phase space properties of charged fields in theories of local observables.** Buchholz, D. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); D'Antoni, C. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 34p. (HEP-TH–9410185). Order Number DE95756021. Source: OSTI; NTIS (US Sales Only); INIS.

Within the setting of algebraic quantum field theory a relation between phase-space properties of observables and charged fields is established. These properties are expressed in terms of compactness and nuclarity conditions which are the basis for the characterization of theories with physically reasonable causal and thermal features. Relevant concepts and results of phase space analysis in algebraic qunatum field theory are reviewed and the underlying ideas are outlined. (orig.)

11293 (DESY–94-188) **Domain wall fermions and chiral gauge theories.** Jansen, K. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 64p. (HEP-LAT–9410018). Order Number DE95756053. Source: OSTI; NTIS (US Sales Only); INIS.

We review the status of the domain wall fermion approach to construct chiral gauge theories on the lattice. (orig.)

11294 (DESY–94-190) **On gravitational dressing of renormalization group β-functions beyond lowest order of perturbation theory.** Dorn, H. (Humboldt-Universitaet, Berlin (Germany). Inst. fuer Elementarteilchenphysik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 11p. (HU-BERLIN-IEP–94/21; HEP-TH–9410084). Order Number DE95756055. Source: OSTI; NTIS (US Sales Only); INIS.

Based on considerations in conformal gauge I derive up to nextleading order a relation between the coefficients of β-functions in 2D renormalizable field theories before and after coupling to quantized gravity. The result implies a coupling constant dependence of the ratio of both β-functions beyond leading order. (orig.)

11295 (DESY–94-202) **Phase structure and phase transition of the SU(2) Higgs model in three dimensions.** Buchmueller, W.; Philipsen, O. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 29p. (HEP-PH–9411334). Order Number DE95755644. Source: OSTI; NTIS (US Sales Only); INIS.

We derive a set of gauge independent gap equations for Higgs boson and vector boson masses for the SU(2) Higgs model in three dimensions. The solutions can be associated with the Higgs phase and the symmetric phase, respectively. In the Higgs phase the calculated masses are in agreement with results from perturbation theory. In the symmetric phase a non-perturbative vector boson mass is generated by the non-abelian gauge interactions, whose value is rather independent of the scalar self-coupling λ. For small values of λ the phase transition is first-order. Its strength decreases with increasing λ, and at a critical value λ_c the first-order transition changes to a crossover. Based on a perturbative matching the three-dimensional theory is related to the four-dimensional theory at high temperatures. The critical Higgs mass $m_H{}^c$, corresponding to the critical coupling λ_c, is estimated to be below 100 GeV. The "symmetric phase" of the theory can be interpreted as a Higgs phase whose parameters are determined non-perturbatively. The obtained Higgs boson and vector boson masses are compared with recent results from lattice Monte Carlo simulations. (orig.)

11296 (DESY–94-203) **A new simulation algorithm for lattice QCD with dynamical quarks.** Bunk, B. (Humboldt-Universitaet, Berlin (Germany). Inst. fuer Physik); Jansen, K.; Luescher, M.; Simma, H.; Jegerlehner, B.; Sommer, R. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 9p. (HEP-LAT–9411016). Order Number DE95756003. Source: OSTI; NTIS (US Sales Only); INIS.

A previously introduced multi-boson technique for the simulation of QCD with dynamical quarks is described and some results of first test runs on a 6^3x12 lattice with Wilson quarks and gauge group SU(2) are reported. (orig.)

11297 (DESY–94-208) **On the local equilibrium condition.** Hessling, H. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 6p. (HEP-TH–9411094). Order Number DE95756004. Source: OSTI; NTIS (US Sales Only); INIS.

A physical system is in local equilibrium if it cannot be distinguished from a global equilibrium by "infinitesimally localized measurements". This should be a natural characterization of local equilibrium, but the problem is to give a precise meaning to the qualitative phrase "infinitesimally localized measurements". A solution is suggested in form of a Local Equilibrium Condition (LEC), which can be applied to linear relativistic quantum field theories but not directly to selfinteracting quantum fields. The concept of local temperature resulting from LEC is compared to an old approach to local temperature based on the principle of maximal entropy. It is shown that the principle of maximal entropy does not always lead to physical states if it is applied to relativistic quantum field theories. (orig.)

11298 (DESY–94-211) **A new approach to spin and statistics.** Kuckert, B. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 17p. Order Number DE95756047. Source: OSTI; NTIS (US Sales Only); INIS.

We give an algebraic proof of the spin-statistics connection for the parabosonic and parafermionic quantum topological charges of a theory of local observables with a modular P_1CT-symmetry. The argument avoids the use of the spinor calculus and also works in 1+2 dimensions. It is expected to be a progress towards a general spin-statistics theorem including also (1+2)-dimensional theories with braid group statistics. (orig.)

11299 (DESY–94-236) **Strong coupling expansion for scattering phases in hamiltonian lattice field theories. Pt. 2. SU(2) gauge theory in (2+1) dimensions.** Dahmen, B. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1994. 50p. (HEP-LAT–9412080). Order Number DE95755642. Source: OSTI; NTIS (US Sales Only); INIS.

A recently proposed method for a strong coupling analysis of scattering phenomena in hamiltonian lattice field theories is applied to the SU(2) Yang-Mills model in (2 + 1) dimensions. The calculation is performed up to second order in the hopping parameter. All relevant quantities that characterize the collision between the lightest glueballs in the elastic region - cross section, phase shifts, resonance parameters - are determined. (orig.)

11300 (FNAL/C–94/270-E) **Search for SUSY at CDF.** Kamon, T. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–86: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95005109. Source: OSTI; NTIS; INIS; GPO Dep.

We have searched supersymmetry (SUSY) using trilepton events in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV. In the Minimal Supersymmetric Standard Model (MSSM), trilepton events are expected from chargino-neutralino ($\tilde{\chi}_1{}^{\pm}\tilde{\chi}_2{}^{0}$) pair production, with subsequent decay into leptons. In all possible combinations of electron and muon channels in 19 pb^{-1}data, we observe no events which pass our trilepton selection criteria. Assuming the GUT hypothesis within the framework of the MSSM, our preliminary analysis excludes $M(\tilde{\chi}_1{}^{\pm}\tilde{\chi}_2{}^{0}) < 46$ GeV/c^2 for $-500 < \mu < -400$ GeV, $2.0 < \tan\beta < 15.0$, and $M(\tilde{q}) = 1.2 \times M(\tilde{g})$.

11301 (FNAL/C–94/418) **The KTeV Pure CsI Calorimeter.** Ray, R.E. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9409268–7: 5. international conference on calorimetry in high energy physics, Upton, NY (United States), 25 Sep - 1 oct 1994). Order Number DE95005747. Source: OSTI; NTIS; INIS; GPO Dep.

KTeV is currently building a state-of-the-art pure CsI electromagnetic calorimeter with a sophisticated digital readout. The CsI array is expected to have better than 1% resolution over a dynamic range of 2–64 GeV. The design of the CsI array is driven by the difficult physics goal of attempting to measure the CP violation parameter $Re(\epsilon'/\epsilon)$ to 1 part in 10000 in a high-rate neutral beam environment. The physics requirements and their impact on the final design will be discussed.

11302 (IHEP–94-4) **A compact expression for bilinear combination of Dirac spinors via world tensors.** Rogalev, R.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 8p. Order Number DE95619200. Source: OSTI; NTIS (US Sales Only); INIS.

A compact expression for a product of two Dirac spinors is obtained as a linear combination of 16 Dirac γ-matrices. The result is presented in a convenient from, which can give rise to using it for analytical calculations of multiparticle amplitudes. It has been shown that a bilinear combination of Dirac spinors can be expressed by momentum and spin vectors of the corresponding particles up to a phase factor. 8 refs.

11303 (IHEP–94-21) **Local solutions of harmonical and Bi-harmonical equations, universal field equation and self-dual configurations of Yang-Mills fields in four dimensions.** Leznov, A.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 6p. Order Number DE95620521. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Lett. Math. Phys.

A general method for the construction of solutions of the d'Alamberian and double d'Alamberian (harmonic and bi-harmonic) equations with local dependence of arbitrary functions upon two independent arguments is proposed. The connection between solutions of this kind and self-dual configurations of gauge fields having no singularities is established. 5 refs.

11304 (IHEP–94-23) **On drawing complicated 3D surfaces.** Nikitin, L.N.; Talanov, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 10p. Order Number DE95619199. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of constructing images of complicated 3D surfaces - world sheets of string is considered. The world sheet representation in the form of a frame of points determined with a specified supporting curve is described. The pictures of the world sheets of free string are constructed using various graphical technologies. 15 refs.; 6 figs.

11305 (IPNO-TH–94-10) **Axial anomaly in the presence of the Aharonov-Bohm gauge field.** Giacconi, P. (Istituto Nazionale di Fisica Nucleare, Bologna (Italy). Dipt. di Fisica 'A. Righi'); Soldati, R.; Ouvry, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Mar 1994. 14p. Order Number DE95619230. Source: OSTI; NTIS (US Sales Only); INIS.

The axial anomaly for Euclidean Dirac fermions in the presence of a background Aharonov-Bohm gauge potential was computed. The non-perturbative result depends on the self-adjoint extensions of the Dirac operator. The role of the quantum mechanical parameters involved in the expression for the axial anomaly is discussed. A derivation of the effective action by means of the stereographic projection is also considered. (authors). 14 refs.

Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Apr 1994. 4p. Order Number DE95619231. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physical Review Letters (US).

Predictions of Akkermans et al. are essentially changed when the Krein spectral displacement operator is regularized by means of zeta function. Instead of piecewise constant persistent current of free electrons on the plane one has a current which varies linearly with the flux and is antisymmetric with regard to all time preserving values of α including 1/2. Different self-adjoint extensions of the problem and role of the resonance are discussed. (authors). 6 refs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 215p. (CONF-9308260–: International Bogolyubov memorial meeting, Dubna (Russian Federation), 19-21 Aug 1993). In *Bogolyubov reading*. Order Number DE95620495. Source: OSTI; NTIS (US Sales Only); INIS.

A lattice regulation of chiral gauge theories is discussed. It is shown, that if one introduces the additional gauge invariant interaction with the Pauli-Villars (P-V)-fields, the model can be treated perturbatively even for a large Yukawa coupling. In this case there is no strong back reaction, on the effective Higgs meson interaction. 11 refs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 215p. (CONF-9308260–: International Bogolyubov memorial meeting, Dubna (Russian Federation), 19-21 Aug 1993). In *Bogolyubov reading*. Order Number DE95620495. Source: OSTI; NTIS (US Sales Only); INIS.

A nonperturbation method is dwelled on in quantum field theory - the variational perturbation theory (VPT). This method combines the variational principle and calculation of the corrections to the leading contribution and uses the functional integration as a mathematical tool. The given method is formulated in terms of the Gaussian functional quadratures (like in perturbation theory). The VPT method is applied to the Green function of the ϕ^4-model in Euclidean d-dimensional space. 19 refs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 6p. Order Number DE95623632. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to International School-Seminar 'Multidimensional Gravity and Cosmology', Yaroslavl, 1994.

Here approximate expressions for the De Donder-Fock harmonic coordinates are given in the case when $kG^2 >> k^2m^2$ and in the case $kG^2 << k^2m^2$, where k is the Newton gravitational constant, G is a scalar constant, m is the mass of a system. Harmonic coordinates appear, in particular, in the Rosen bi metric general relativity and in the Chernikov theory with two connections but one metric if one passes to the Einstein theory. They both contain a generalized condition, which tends to the De Donder harmonic condition in the limiting case. 6 refs., 2 figs.

Los Alamos National Lab., NM (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409103–14: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95005158. Source: OSTI; INIS; NTIS; GPO Dep.

The parity and time-reversal symmetries can be studies in neutron-nucleus interactions. Parity non-conserving asymmetries have been observed for many p-wave resonances in a compound nucleus and measurements were performed on several nuclei in the mass region of A∼100 and A∼230. The statistical model of the compound nucleus provides a theoretical basis for extracting mean-squared matrix elements from the experimental asymmetry data, and for interpreting the mean-squared matrix elements. The constraints on the weak meson-exchange couplings calculated from the compound-nucleus asymmetry data agree qualitatively with the results from few-body and light-nuclei experiments. The tests of time-reversal invariance in various experiments using thermal, epithermal and MeV neutrons are being developed.

11315 (BONN-IR–94-18) **The calculation of the quark distribution amplitudes of decuplet baryons by means of QCD sum rules.** Bonekamp, J. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Nov 1994. 278p. (In German). Order Number DE95755988. Source: OSTI; NTIS (US Sales Only); INIS.

Using the QCD sum rule technique, we derive the quark distribution amplitudes of the decuplet memebers $\Delta(1232)$, $\Sigma^*(1385)$, $\Xi^*(1530)$ and $\Omega(1672)$. Generalizing the treatment of the Bethe-Salpeter amplitude, we can distinguish spin- and orbital- angular momentum parts of the quark distributions and establish separate sum rules for the contributions. Projecting out the angular momentum 1/2 contributions, we obtain sum rules which are saturated by the lowest resonance in the given iso spin channel, thus resolving deficiencies of the standard approach. We find that for helicity 1/2 the spin part of the quark distributions is asymmetric. Also the orbital angular momentum contributions are extremely asymmetric and tend to decrease the asymmetry of the spin part. As a result of SU(3) symmetry breaking, configuration mixing occurs and the decuplet baryons Σ^* and Ξ^* receive octet contributions. The antisymmetric part of these octet contributions is calculated. (orig.)

11316 (BUDKERINP–94-24) **Instanton - antiinstanton interaction and asymptotics of perturbation theory expansion of in double well oscillator.** Faleev, S.V.; Sil'vestrov, P.G. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1994. 15p. (IYaF–94-24.). Order Number DE95619245. Source: OSTI; NTIS (US Sales Only); INIS.

Instanton - antiinstanton pair is considered as a source of singularity at the Borel plane for the ground state energy of anharmonic oscillator. The problem of defining the short range instanton - antiinstanton interaction reduces to calculation of a smooth part of the Borel function. The one - loop quantum contribution to instanton - antiinstanton interaction and the second quantum correction to a single instanton density were considered. 11 refs., 2 tabs.

The expression for the first recoil correction to the Dirac-Coulomb spectrum is obtained in terms of gauge invariant quantum electrodynamics. 2 refs., 2 figs.

11318 (CONF-940816–89) **Physics with relativistic heavy ions: QGP and other delicacies.** Young, G.R. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Meeting of the Division of Particles and Fields of the American Physical Society; Albuquerque, NM (United States); 2-6 Aug 1994. Order Number DE95007014. Source: OSTI; NTIS; INIS; GPO Dep.

Conditions favorable to formation and observation of a deconfined state of quarks and gluons (often called the quark-gluon plasma) are thought to exist following the collision of very heavy nuclei at center-of-mass energies exceeding several tens of GeV/nucleon. The Relativistic Heavy Ion Collider under construction at BNL since 1991 is designed to provide such collisions at energies up to $\sqrt{s}/A = 200$ GeV. Two large dedicated experiments are being built to operate there; these two experiments take rather different approaches to the problem of classifying such collisions and probing for signals of QGP formation. Two smaller experiments are proposed to focus on specific aspects of these collisions. Recent developments in the understanding of the initial state formed in such collisions include, particularly, the possible rapid equilibration of the gluon density, leading in an equilibrium picture to such high temperatures that sizable thermal excitation of charm becomes probable. Recent theoretical conjectures have focussed on the possible formation of a disordered chiral condensate following chiral symmetry restoration in heavy-nucleus collisions, which might be a consequence of nonequilibrium deexcitation of a dense partonic state.

11319 (DESY–94-002) **A novel approach to confront electroweak data and theory.** Hagiwara, K. (KEK National High Energy Physics, Tsukuba (Japan)); Matsumoto, S.; Haidt, D.; Kim, C.S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 76p. (KEK-TH–375; KEK–93-159(prepr.); KANAZAWA–94-19; YUMS–94-22; SNUTP–94-82). Order Number DE95745811. Source: OSTI; NTIS (US Sales Only); INIS.

A novel approach to study electroweak physics at one-loop level in generic $SU(2)_L \times U(1)_Y$ theories is introduced. It separates the 1-loop corrections into two pieces: process specific ones from vertex and box contributions, and universal ones from contributions to the gauge boson propagators. The latter are parametrized in terms of four effective form factors anti $e^2(q^2)$, anti $s^2(q^2)$, anti $g_Z{}^2(q^2)$ and anti $g_W{}^2(q^2)$ corresponding to the $\gamma\gamma$, γZ, ZZ and WW propagators. Under the assumption that only the Standard Model contributes to the process specific corrections, the magnitudes of the four form factors are determined at $q^2=0$ and at $q^2=m_Z{}^2$ by fitting to all available precision experiments. These values are then compared systematically with predictions of $SU(2)_L \times U(1)_Y$ theories. In all fits $\alpha_s(m_Z)$ and anti anti alpha$(m_Z{}^2)$ are treated as external parameters in order to keep the interpretation as flexible as possible. The treatment of the electroweak data is presented in detail together with the relevant theoretical formulae used to interpret the data. No deviation from the Standard Model has been identified. Ranges of the top quark and Higgs boson masses are derived as functions of $\alpha_s(m_Z)$ and anti $\alpha(m_Z{}^2)$. Also discussed are consequences of the recent precision measurement of the left-right asymmetry at SLC as well as the impact of a top quark mass and an improved W mass measurement. (orig.)

11320 (DESY–94-200) **Naive nonabelianization and resummation of fermion bubble chains.** Beneke, M. (Michigan Univ., Ann Arbor (United States). Randall Lab. of Physics); Braun, V.M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 14p. (UM-TH–94-37; HEP-PH–9411229). Order Number DE95756002. Source: OSTI; NTIS (US Sales Only); INIS.

We propose to extend the Brodsky-Lepage-Mackenzie scale-fixing prescription by resumming exactly any number of one-loop vacuum polarization insertions into one-loop diagrams. In this way, one makes maximal use of the information contained in one-loop perturbative corrections combined with the one-loop running of the effective coupling. The scale ambiguity at leading order is converted into an intrinsic uncertainty of perturbative approximations

induced by IR renormalons. Practical implementation of this resummation requires only knowledge of one-loop radiative corrections with non-vanishing gluon mass. We find that higher order corrections to the pole mass and the top quark decay width are dominated by renormalons already in low orders and demonstrate the impact of eliminating the pole mass on the convergence of the perturbative series. (orig.)

11321 (DOE/ER/40561–175) **The gluon propagator in non-Abelian Weizsaecker-Williams fields.** Ayala, A. (Univ. of Minnesota, Minneapolis, MN (United States). School of Physics and Astronomy); Jalilian-Marian, J.; McLerran, L.; Venugopalan, R. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. Jan 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE95006877. Source: OSTI; NTIS; INIS; GPO Dep.

The authors carefully compute the gluon propagator in the background of a non-Abelian Weizsaecker-Williams field. This background field is generated by the valence quarks in very large nuclei. They find contact terms in the small fluctuation equations of motion which induce corrections to a previously incorrect result for the gluon propagator in such a background field. The well known problem of the Hermiticity of certain operators in Light Cone gauge is resolved for the Weizsaecker-Williams background field. This is achieved by working in a gauge where singular terms in the equations of motion are absent and then gauge transforming the small fluctuation fields to Light Cone gauge.

11322 (ENEA-RT-INN–94-38) **Mass-matrices of weak interaction, quark flavour mixing and exponential form of Cabibbo-Kobayashi-Maskawa matrix.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Torre, A. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 22p. (RT/INN–94-38). Order Number DE95749714. Source: OSTI; NTIS (US Sales Only).

The quark mixing matrix is diagonalized. The use of the exponential parametrization leads to strightforward results, obtained in exact form, without simplifying assumptions. Weak interaction eigenstates in the sense of Fritzch and Planckl are defined. The relevant mass matrices are derived and are shown to belong to Barnhill canonical forms. It is proven that, at lowest order, these matrices exhibit a democratic structure. The mechanism of democracy breaking is finally discussed.

11323 (FZR–55) **Pushing and cranking corrections to the Meson fields of the bosonized Nambu and Jona-Lasinio model.** Schleif, M. (Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Kern- und Hadronenphysik); Wuensch, R. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). Sep 1994. 16p. Order Number DE95745819. Source: OSTI; NTIS (US Sales Only); INIS.

We study the effect of center-of-mass motion and rotational corrections on hedgehog meson fields in the bosonized two-flavor Nambu and Jona-Lasinio model. To remove the spurious motion and to restore good spin and isospin we consider a boosted and rotating soliton instead a static soliton at rest. Modified meson fields are obtained by minimizing a corrected effective energy functional. The importance of the modification is estimated by evaluating expectation values of several observables. Stabile solitonic configurations are obtained for M> or ≈300 MeV, while static solitons exists for M> or ≈350 MeV only. Despite the considerable size of the energy corrections (30-50% of the soliton energy) the main features of the static soliton are preserved. Modified meson profiles are somewhat narrower than static ones and have a different asymptotic behavior, which depends on the isospin quantum number. The modifications increase with increasing constituent quark mass. The valence-quark picture dominates up to very large constituent quark masses. In the physically relevant mass region, the root-mean square radius of the quark distribution is reduced by less than 10 percent. The Δ-nucleon mass-splitting is still weaker affected. (orig.)

11324 (GSI–94-86(prepr.)) **Instanton content of finite temperature QCD matter.** Chu, M.C. (California Inst. of Tech., Pasadena, CA (United States). W.K. Kellogg Radiation Lab.); Schramm, S. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 22p. Order Number DE95755990. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate the temperature dependence of the instanton content of gluon fields and their contribution to quark correlation using quenched lattice QCD and the cooling method. We found a suppression of the topological susceptibility at finite temperature, agreeing with the PCAC expectation at low temperature and enhanced suppression for temperatures at and above the deconfinement transition. For temperatures up to about 334 MeV, the topological charge correlation agrees well with a single instanton profile, though the size parameter seems to change across the phase transition. The screening wave-functions for the pion and the rho become slightly more compact at higher temperatures. Lattice cooling shows no contribution from the instantons to the screening wavefunctions at temperatures above the phase transition. (orig.)

Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Helvetica Physica Acta.

The physical variables for pure Yang-Mills theory in four-dimensional Minkowski space-time are constructed without using a gauge-fixing condition by the explicit resolving of the non-Abelian Gauss constraint and by the Bogolyubov transformation that diagonalizes the kinetic term in reduced action (action on constraint shell). As a result, the reduced action is expressed in terms of gauge invariant field variables including an additional global (only time-dependent) one, describing zero mode dynamics of the Gauss constraint. This additional variable reflects the symmetry group of topologically nontrivial transformations remaining after the reduction. (It gives also the characteristic of the Gribov ambiguity from the point of view of the gauge fixing method). The perturbation theory in terms of quasiparticles with the new stable vacuum, which is defined through the zero mode configuration, is proposed. It was shown that the averaging of Green's functions for quasiparticles over the global variable describes the mechanism of color confinement. 21 refs.

Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yadernaya Fizika.

The spin effects at high energies and momenta transferred $-t-> 1$ GeV^2 are analyzed for quark-photon scattering. The energy independence of the ratio of spin-flip and spin-non-flip amplitudes in the same α_s order of QCD is obtained. It is shown that the contribution of the spin-dependent quark-pomeron vertex to the spin-flip amplitude is intensified by off-mass-shell effects in the quark loop. As a result, the magnitude of this amplitude can reach 20-30% from spin-non-flip one. The dependence of the cross-section on the form factor and α_s^3, spin-non-flip contributions are observed. 12 refs., 4 figs.

(Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Silagadze, Z.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 7p. (In Russian). Order Number DE95623675. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yadernaya Fizika.

The radiative corrections to the large-angle three photon annihilation differential cross section in high energy electron-positron collisions are calculated in logarithmic approximation. We show that the result can be written in the form of Drell-Yan process cross section. The accuracy of logarithmic approximation is estimated to be 4-6%. 4 refs.

11332 (LA-UR-95-73) **Topological density and instantons on a lattice.** Grandy, J. (Ohio State Univ., Columbus, OH (United States)); Gupta, R. Los Alamos National Lab., NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409269–7: Lattice '94, Bielefeld (Germany), 25 Sep - 1 oct 1994). Order Number DE95006348. Source: OSTI; NTIS; GPO Dep.

The authors present an update on the study of topological structure of QCD. Issues addressed include a comparison between the plaquette and the geometric methods of calculating the topological density. They show that the improved gauge action based on $\sqrt{3}$ blocking transformation suppresses the formation of topologically charged dislocations with low action. Using a cooling method they identify the instantons location, estimate their size and density, and calculate the renormalization constant Z_Q for the plaquette method.

11333 (LUNFD6-NFFL–7090) **Studies of various aspects of the proton structure in deep inelastic scattering at HERA and identification of quark and gluon jets.** Nyberg-Werther, M. Lund Univ. (Sweden). Dept. of Physics. 15 Nov 1994. 44p. Order Number DE95620527. Source: OSTI; NTIS; INIS.

This thesis is based on work done as a member of the H1 detector collaboration at DESY during 1989-1994 and consists of three main topics. The possibility to probe the predicted intrinsic charm component in the proton by deep inelastic scattering is investigated in a simulation study, including HERA and a fixed target experiment. For existing experiments the predicted statistics are relatively small, but may still contribute to a solution of the issue. A determination of the gluon density has been obtained in the region $5x10^{-3} < x < 8x10^{-2}$ by measuring the cross section of photon gluon fusion in deep inelastic scattering with the H1 detector at the ep-collider HERA. This direct measurement of the gluon density was based on an integrated luminosity of 242 nb^{-1} and was performed in a kinematic region previously not accessible. The problem of identifying jets at LEP and HERA has been studied. The identification was based on jet energies and fragmentation properties, but instead of working with the separation variables directly, these have been used to calculate probabilities for having a gluon (or quark) according to Bayes' theorem. 24 refs, 16 figs.

A measurement of the strong coupling constant α_s using the event-shape variable y_3 (the differential two-jet rate) in the reaction $e^+e^- \rightarrow$ hadrons is presented. The analysis is based on data from the TPC/Two-Gamma detector at the PEP e^+e^- storage ring taken between 1984 and 1986 at a center-of-mass energy of E_{cm} = 29 GeV. A value of $\alpha_s(29\ \text{GeV}) = 0.160 \pm 0.012$ is obtained, where the error is the quadratic sum of experimental and theoretical uncertainties. The procedure for determining α_s is the same as that used by the ALEPH and TOPAZ experiments, which allows for a consistent comparison of the α_s values obtained at different center-of-mass energies. The observed energy dependence "running" of α_s is found to be in good agreement with the QCD prediction, and is clearly incompatible with a constant value.

11335 (WUB-DIS–94-2) **Determination of the strong coupling constant $\alpha_s(M_Z^2)$ under regardment of completely resummed leading and next-to-leading logarithms. Analysis of global event variables measured in hadronic Z decays.** Wehr, A. Wuppertal Univ. (Gesamthochschule) (Germany). Fachbereich 8 - Naturwissenschaften 1 - Physik. Jun 1994. 131p. (In German). Order Number DE95756064. Source: OSTI; NTIS (US Sales Only); INIS.

The value of the strong coupling constant α_s is determined from a combined analysis of the global event shape variables thrust, heavy jet mass and total and wide jet broadening. The extraction of α_s includes the full calculation of $O(\alpha_s^2)$ terms and leading and next-to-leading logarithms resummed to all orders of α_s. The analysis is based on data taken with the DELPHI detector at LEP during 1991 and 1992. The dependence of the result on the detailed matching of the resummed and fixed order terms is studied. The result from the combined theory is compared with values coming from a pure NLLA analysis and as pure $O(\alpha_s^2)$ analysis, respectively. It is found that the inclusion of the resummed logarithms allows the description of the data in the two jet range and reduces the scale dependence of $\alpha_s(M_Z^2)$ compared to pure $O(\alpha_s^2)$ theory. The value using the combined NLLA+$O(\alpha_s^2)$ theory at the scale $\mu^2=M_Z^2$ is $\alpha_S(M_Z^2)=0.118\pm0.007$. The running of α_s is measured from the 1991 data in an energy range from 88.5 to 93.7 GeV. The slope of α_s obtained at the Z peak is $d\alpha_s/dQ/_{Q=M_Z}=-(2.9\pm2.8)x10^{-4}\text{GeV}^{-1}$. This value is compatible with QCD and exludes an abelian gluon model with more than two standard deviations. (orig.)

11336 (ANL/HEP/CP–94-91) **Decays rates for S- and P-wave bottomium.** Bodwin, G.T.; Kim, S.; Sinclair, D.K. Argonne National Lab., IL (United States). Nov 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409269–6: Lattice '94, Bielefeld (Germany), 25 Sep - 1 oct 1994). Order Number DE95007090. Source: OSTI; NTIS; INIS; GPO Dep.

The authors use the Bodwin-Braaten-Lepage factorization scheme to separate the long- and short-distance factors that contribute to the decay rates of Υ, η_b (S-wave) and χ_b,h_b (P-wave). The long distance matrix elements are calculated on the lattice in the quenched approximation using a non-relativistic formulation of the b quark dynamics.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9409269–5: Lattice '94, Bielefeld (Germany), 25 Sep - 1 oct 1994). Order Number DE95005685. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results from the MILC Collaboration for f_B, f_{B_s}, f_D, f_{D_s} and their ratios are presented. We compute in the quenched approximation at β = 6.3, 6.0 and 5.7 with Wilson light quarks and static and Wilson heavy quarks. We attempt to quantify all systematic errors other than quenching.

E777 has set 90% C.L. branching ratio upper limits of 2.1 x 10^{-10} for the decays $K^+ \rightarrow \pi^+\mu^+e^-$ and 4.5 x 10^{-7} for $K^+ \rightarrow \pi^+A^0$, where A^0 is any particle of mass less than 100 MeV/c^2 decaying into e^+e^- with lifetime less than 10^{-13} sec. E851 measured the BR($K^+ \rightarrow \pi^+e^+e^-$) = ($2.97_{-0.22}{}^{+0.19}$) x 10^{-7} and BR($\pi^0 \rightarrow e^+e^-$) = (8.0 ± 2.6 ± 0.6) x 10^{-8}. E865 is preparing to take data in 1995 which should greatly improve these results.

11340 (DESY–93-017) **Search for leptoquarks with the ZEUS detector.** Derrick, M. (Argonne National Lab., IL (United States)); Krakauer, D.; Magill, S. ZEUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Mar 1993. 16p. Order Number DE95756321. Source: OSTI; NTIS (US Sales Only); INIS.

A search for any resonant state coupled to an electron and a proton constituent has been performed using collision of electron and proton beams at HERA. In a sample with integrated luminosity of 26 nb^{-1}, no evidence has been found for production of leptoquarks with decays to e^-+jet or ν+jet. Limits on the coupling strength of scalar leptoquarks to electron and quark have been determined for masses above 25 GeV. For example, scalar isosinglet leptoquarks (S_o) with electroweak coupling strength to (e^-u) states are ruled out at the 95% confidence level for masses below 168 GeV for left-handed couplings and below 176 GeV for right-handed couplings. (orig.)

11341 (DESY–93-054) **Search for rare B meson decays into D^+_s mesons.** Albrecht, H. (DESY, Hamburg (Germany)); Ehrlichmann, H.; Hamacher, T. ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Apr 1993. 16p. Order Number DE95756319. Source: OSTI; NTIS (US Sales Only); INIS.

A search has been performed for rare B meson decays into D_s^+ mesons arising from b → u transitions, W exchange modes, B^+ annihilation processes, and decays where the D_s^+ is not produced via a W → c anti s quark pair coupling, using the ARGUS detector operating on the Y(4S) resonance at the e^+e^- storage ring DORIS II. Upper limits for individual decay modes are obtained. In addition, from a study of $D_s^+l^-$ correlations an upper limit of BR(B → $D_s^+l^-$X) < 1.2% (90% CL) is determined. (orig.)

11342 (DESY–94-102) **Two-loop $O(\alpha_s G_F m_t^2)$ correlation to the H →b anti b decay rate.** Kniehl, B.A. (Max-Planck-Institut fuer Physik, Muenchen (Germany)); Spira, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 18p. Order Number DE95745794. Source: OSTI; NTIS (US Sales Only); INIS.

We present the two-loop $O(\alpha_s G_F m_t^2)$ correction to the b anti b decay rate of the Standard-Model Higgs boson, assuming that the t quark is much heavier than the Higgs boson. Apart from the universal correction connected with the renormalizations of the wave function and the vacuum expectation value of the Higgs field, this involves vertex corrections specific to the presence of beauty in the final state. We calculate the latter by means of a low-energy theorem. All would-be mass singularities related to the b quark can be absorbed into the running Higgs-bottom Yukawa coupling. It turns out that the total $O(\alpha_s G_F m_t^2)$ correction screens the leading high-m_t behaviour of the one-loop result by 71% to 75% for M_H between 60 GeV and 2 M_W. (orig.)

11343 (DESY–94-154) **A search for leptoquarks and squarks at HERA.** Ahmed, T. (Birmingham Univ. (United Kingdom). School of Physics and Space Research); Aid, S.; Andreev, V. H1 Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 29p. Order Number DE95756109. Source: OSTI; NTIS (US Sales Only); INIS.

A search in the H1 experiment at HERA for scalar and vector leptoquarks, leptogluons and squarks coupling to first generation fermions is presented in a data sample corresponding to an integrated luminosity of 425 nb^{-1}. For masses ranging up to ≈275 GeV, no significant evidence for the direct production of such particles is found in various possible decay channels. At high masses and beyong the centre of mass energy of 296 GeV a contact interaction analysis is used to further constrain the couplings and masses of new vector leptoquarks and to set lower limits on compositeness scales. (orig.)

11344 (DESY–94-160) **Recent results from ep scattering at HERA.** Haas, T. H1 Collaboration; ZEUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 20p. (CONF-9405162–: Symposium on particles, strings and cosmology, Syracuse, NY (United States), 19-24 May 1994). Order Number DE95746154. Source: OSTI; NTIS (US Sales Only); INIS.

The HERA experiments, H1 and ZEUS, had their second running period during the summer and fall of 1993 collecting 0.5 pb^{-1} of data each, a twentyfold increase in statistics over the previous running period. This large increase in statistics together with an improved understanding of the detectors has brought a wide range of physics questions within the reach of the experiments. In this report we give a brief overview of some of the studies performed recently. (orig.)

11345 (DESY–94-162) **Diffractive vector meson production at large momentum transfer.** Forshaw, J.R. (Rutherford Appleton Lab., Chilton (United Kingdom)); Ryskin, M.G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 32p. (RAL–94-058). Order Number DE95746153. Source: OSTI; NTIS (US Sales Only); INIS.

The diffractive process γp→V+X (where V is a vector meson and X results from the dissociation of the proton) is studied. In particular, we consider the region of large momentum transfer (i.e. vertical stroke tvertical stroke $>> \Lambda_{QCD}{}^2$) and large centre-of-mass (CM) energy, s. The asymptotic (s→∞, s/vertical stroke tvertical stroke

>>1) behaviour is derived from the BFKL equation and compared to that which is obtained in the Born approximation (two-gluon exchange). We also calculate the corrections to the Born graphs by iterating the BFKL kernel numerically. Improved convergence of the BFKL series is found by summing the logarithms which occur when an exchanged gluon goes nearly on shell. Importantly, we find evidence that the asymptotic solution to the BFKL equation is inappropriate over the HERA range and we provide more realistic predictions for the cross section. The predicted cross section is not too small and can be measured at HERA, up to momentum transfers vertical stroke tvertical stroke $\propto 10$ GeV^2. (orig.)

11346 (DESY–94-163) **Transverse momentum distributions in large-rapidity dijet production at the Tevatron.** Duca, V. del (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Schmidt, C.R. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 8p. (CONF-9406300–: 6. Rencontres de Blois: heart of the matter - from nuclear interactions to quark-gluon dynamics, Blois (France), 19-25 Jun 1994; SCIPP–94/27; HEP-PH–9410341). Order Number DE95745796. Source: OSTI; NTIS (US Sales Only); INIS.

In this contribution we examine the transverse momentum distributions in dijet production at large rapidity intervals at the Tevatron, using the BFKL resummation. (orig.)

11347 (DESY–94-168) **Tau decays.** Golutvin, A. (Institut Teoreticheskoj i Ehksperimental'noj Fiziki, Moscow (Russian Federation)). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 23p. Order Number DE95745812. Source: OSTI; NTIS (US Sales Only); INIS.

The most recent experimental results of τ physics are reviewed. The covered topics include precision measurements of semihadronic τ decay and their impact on tau branching ratio budget, the current status of the tau consistency test, a determination of Michel parameters and τ neutrino helicity, and upper limits on lepton-number violating τ decays. (orig.)

11348 (DESY–94-170) **CP violation and strong phases from penguins in $B^{\pm} \to PP$ and $B^{\pm} \to VP$ decays.** Kramer, G. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Palmer, W.F.; Simma, H. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 23p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 056HH93P. Order Number DE95745793. Source: OSTI; NTIS (US Sales Only); INIS.

We calculate direct CP-violating rate asymmetries in charged $B \to PP$ and $B \to VP$ decays arising from the interference of amplitudes with different strong and CKM phases. The perturbative strong phases develop at order α_s from absorptive parts of one-loop matrix elements of the next-to-leading logarithm corrected effective Hamiltonian. CPT constraints are maintained. Based on this model, we find that partial rate asymmetries between charge conjugate $B^{\pm}$ decays can be as high as 20% for certain channels with branching ratios in the 10^{-6} range. Because the c anti c threshold lies so close to the physical momentum scale, the asymmetries depend sensitively on the model assumptions used to evaluate the imaginary parts of the matrix elements, in particular, on the internal momentum transfer. The charge asymmetries of partial rates would provide unambiguous evidence for direct CP violation. (orig.)

11349 (DESY–94-172) **Theoretical update of the semileptonic branching ratio of B mesons.** Bagan, E. (Universitat Autonoma de Barcelona (Spain). Dept. de Fisica); Gosdzinsky, P.; Ball, P.; Braun, V.M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 13p. (TUM-T31–68/94; UAB-FT–348; HEP-PH–9409440). Order Number DE95745815. Source: OSTI; NTIS (US Sales Only); INIS.

We reconsider the prediction of the semileptonic branching ratio of B mesons, using a recent calculation of the radiative corrections with account for finite quark masses in nonleptonic decays and taking into account $1/m_b^2$ corrections. For the semileptonic branching ratio we obtain $B_{SL}=(11.8\pm1.6)\%$ using pole quark masses and $B_{SL}=(11.0\pm1.9)\%$ using running anti M anti S quark masses. The uncertainty is dominated by unknown higher oder perturbative corrections. We conclude that the present accuracy of the theoretical analysis does not allow to state a significant disagreement with the experimental results. However, our re-analysis of the decay $b \to ccs$ yields an increase of $(35\pm11)\%$ due to next-to-leading order corrections including mass dependent terms, which further emphasizes the problem of the average charm quark content of the final state in B decays. (orig.)

11350 (DESY–94-176) **Inclusive jet differential cross sections in photoproduction at HERA.** Derrick, M. (Argonne National Lab., IL (United States)); Krakauer, D.; Magill, S. ZEUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 26p. Order Number DE95756111. Source: OSTI; NTIS (US Sales Only); INIS.

Inclusive jet differential cross sections for the reaction $ep \to jet+X$ at Q^2 below 4 GeV^2 have been measured with the ZEUS detector at HERA using an integrated luminosity of 0.55 pb^{-1}. These cross sections are given in the kinematic region $0.2<y<0.85$, for jet pseudorapidities in the ep-laboratory range $-1<\eta^{jet}<2$ and refer to jets at the handron level with a cone radius of one unit in the η-ϕ plane. These results correspond to quasi-real photoproduction at centre-of-mass energies in the range 130-270 GeV and, approximately, for jet pseudorapidities in the interval $-3<\eta^{jet}(\gamma p\ CMS)<0$. These measurements cover a new kinematic regime of the partonic structure of the photon, at typical scales up to $\propto 300$ GeV^2 and photon fractional momenta down to $x_\gamma \propto 10^{-2}$. Leading logarithm parton shower Monte Carlo calculations, which include both resolved and direct processes and use the predictions of currently available parametrisations of the photon parton distributions, describe in general the shape and magnitude of the measured η^{jet} and E_T^{jet} distributions. (orig.)

11351 (DESY–94-177) **Evidence for W exchange in charmed baryon decays.** Albrecht, H. (DESY, Hamburg (Germany)); Hamacher, T.; Hofmann, R.P. ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 14p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 054DO51P; Foerderkennzeichen BMFT 056DD1 Order Number DE95756110. Source: OSTI; NTIS (US Sales Only); INIS.

Using the detector ARGUS at the e^+e^- storage ring DORIS II at DESY, we have observed the decay $\Lambda_c^+ \to \Xi^- K^+ \pi^+$ and $\Lambda_c^+ \to \Xi^{*0} K^+$ and obtained evidence for the decay $\Sigma_c^0 \to \Lambda K_s^0$. All three of these decays are of interest as they provide information about W-exchange processes. The products of cross sections and branching ratios for $\Lambda_c^+ \to \Xi^- K^+ \pi^+$ and $\Lambda_c^+ \to \Xi^{*0} K^+$ are $(1.7\pm0.3\pm0.3)$pb and $(0.6\pm0.2\pm0.1)$pb, respectively, which implies that $(35\pm17)\%$ of the $\Sigma^- K^+ \pi^+$ final state is generated through a two-body decay via intermediate W-exchange. The product of production cross section and branching ratio for $\Xi_c^0 \to \Lambda K_s^0$ is $(2.1\pm1.0\pm0.6)$pb. (orig.)

11352 (DESY–94-179) **Instanton-induced production of QCD jets.** Balitsky, I.I. (Pennsylvania State Univ., University Park, PA (United States). Dept. of Physics); Braun, V.M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 10p. (PSU-TH–150; HEP-PH–9410271). Order Number DE95745795. Source: OSTI; NTIS (US Sales Only); INIS.

We consider the instanton contributions for the production of a gluon jet with large transverse momentum in QCD. We find that Mueller's corrections corresponding to the rescattering of hard quanta are likely to remove contributions of large instantons, making this cross section well defined. This observation generalizes the previous discussion of instanton effects in the deep inelastic scattering and suggests that all hard processes in the QCD receive hard non-perturbative corrections from instantons of small size, of order $\rho \propto 1/(Q\alpha_s)$. (orig.)

11353 (DESY–94-181) **Ioffe-time distributions instead of parton momentum distributions in description of deep inelastic scattering.** Braun, V. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Gornicki, P.; Mankiewicz, L. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 38p. (HEP-PH–9410318). Order Number DE95756037. Source: OSTI; NTIS (US Sales Only); INIS.

We argue that parton distributions in coordinate space provide a more natural object for nonperturbative methods compared to the

usual momentum distributions in which the physics of different longitudinal distances is being mixed. To illustrate the advantages of the coordinate space formulation, we calculate the coordinate space distributions for valence quarks in the proton using the QCD sum rule approach. A remarkable agreement is found between the calcuulated and the experimentally measured u-quark distribution up to distances of order α2 fm in the proton rest frame. The standard calculation completely fails, however, for valence d quarks; the reasons for this discrepancy are discussed. (orig.)

11354 (DESY–94-185) **The process $e^+e^- \rightarrow$l anti lq anti q at LEP and NLC.** Bardin, D. (European Organization for Nuclear Research, Geneva (Switzerland). Theoretical Physics Div.); Leike, A.; Riemann, T. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Oct 1994. 11p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 05GMU93P. (CERN-TH–7478/94; LMU–18/94; HEP-PH–9410361). Order Number DE95756036. Source: OSTI; NTIS (US Sales Only); INIS.

The cross sections for the reaction $e^+e^- \rightarrow$l anti lq anti q and for similar four fermion production processes at LEP 1, LEP 2 and the NLC are calculated. Due to the extraordinary symmetry properties of the process, very compact analytical formulae describe the double differential distributions in the invariant masses of the l anti l and q anti q pairs. The total cross sections may be obtained with two numerical integrations. (orig.)

11355 (DESY–94-187) **New results from HERA on deep inelastic scattering at low x, the proton structure function, jets in photoproduction, heavy flavour production and searches for new particles.** Brisson, V. (Universite de Paris-Sud, Orsay (France). Lab. de l'Accelerateur Lineaire); Hufnagel, H.; Kleinwort, C.; Koehler, T.; Raedel, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 25p. (CONF-940722–: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95756056. Source: OSTI; NTIS (US Sales Only); INIS.

We present new results on the proton structure function F_2 for values of x_{Bj} down to 10^{-4}. The results are based on data taken in 1993 by the H1 experiment at HERA. From a leading order QCD analysis of the structure function information on the gluon content in the proton is obtained. Studies on exclusive final states at low x_{Bj} havve been performed. The results demonstrate that in future these studies can help to decide whether DGLAP - or BFKL-dynamics are to be used in the present small x_{Bj} regime. (orig.)

11356 (DESY–94-197) **Towards the phenomenology of QCD-instanton induced particle production at HERA.** Ringwald, A.; Schrempp, F. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 26p. (CONF-9405293–: International seminar on quarks, Vladimir (Russian Federation), 11-18 May 1994; HEP-PH–9411217). Order Number DE95756035. Source: OSTI; NTIS (US Sales Only); INIS.

We present a first status report on a broad and systematic study of possible manifestations of QCD-instantons at HERA. Considerable motivation comes from the close analogy between instanton-induced B+L violation in electroweak processes and effects of QCD-instantons in deep inelastic scattering. We concentrate on the high multiplicity final state structure, reminiscent of an isotropically decaying 'fireball'. A set of experimental isolation criteria is proposed. They serve to further enhance the striking event signature without significantly suppressing the expected rates. (orig.)

11357 (DESY–94-204) **New results from HERA on photoproduction and diffraction, the proton structure function, deep inelastic scattering at low x, heavy flavour production, jets and searches for leptoquarks.** Barreiro, F. (Universidad Autonoma de Madrid (Spain)); Bhadra, S.; Lancaster, M.; Lim, J.N.; Soeldner-Rembold, S.; Straub, B. ZEUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 33p. (CONF-940722–: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95751928. Source: OSTI; NTIS (US Sales Only); INIS.

This report contains some of the papers presented by the ZEUS Collaboration at the 27th international conference on high energy physics in Glasgow (20-27 July 1994). These concern deep inelastic ep scattering at low x, photoproduction and diffraction in ep scattering, a measurement of the proton structure function and determination of the low-x gluon distribution, D^* and J/Ψ production in ep scattering, multi-jet production and determination of α_s in ep scattering, and the search for leptoquarks in ep collisions. (HSI)

11358 (DESY–94-207) **Inelastic J/ψphotoproduction.** Kraemer, M. (Mainz Univ. (Germany). Inst. fuer Physik); Zunkft, J.; Steegborn, J.; Zerwas, P.M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 13p. (MZ-TH–94-28; TTP–94-20; HEP-PH–9411372). Order Number DE95756001. Source: OSTI; NTIS (US Sales Only); INIS.

Inelastic photoproduction of J/ψ particles at high energies is one of the processes to determine the gluon distribution in the nucleon. We have calculated the QCD radiative corrections to the color-singlet model of this reaction. They are large at moderate photon energies, but decrease with increasing energies. The cross section and the J/ψ energy spectrum are compared with the available fixed-target photoproduction data and predictions are given for the HERA energy range. (orig.)

11359 (DESY–94-218) **Search for signatures of dilepton gauge bosons in HERA and LEPII-LHC.** Sasaki, Ken (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Tokushuku, Katsuo; Yamada, Sakue; Yuji, Yamazaki. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 16p. Order Number DE95755998. Source: OSTI; NTIS (US Sales Only); INIS.

We examine the prospects of searching for dilepton gauge bosons in e^-p colliders. Specifically we take a $SU(3)_C xSU(3)_L xU(1)_X$ model and calculate the cross section for the process, $e^-p \rightarrow e^+ + D +$anything, mediated by doubly-charged dilepton gauge bosons, where D is a new quark predicted by the model. At HERA, with center-of-mass energy $\sqrt{s}$=314 GeV and the integrated luminosity 100pb^{-1}, we can obtain the signature of dileptons with mass up to 340 GeV (650 GeV) if D has a mass lighter than 200 GeV (150 GeV). At LEPII-LHC, with center-of-mass energy $\sqrt{s}$=1790 GeV and the anticipated luminosity 6fb^{-1}yr^{-1}, we expect more than 280 events per year provided that both masses of dileptons and D-quarks are less than 1 TeV. (orig.)

11360 (DESY–95-215) **Photoproduction physics at HERA.** Burow, B.D. (Hamburg Univ. (Germany). 2. Inst. fuer Experimentalphysik); Erdmann, M.; Kaschowitz, R.; Levonian, S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1994. 66p. (CONF-9405266–: Workshop on two-photon physics at LEP and HERA: status of data and models, Lund (Sweden), 26-28 May 1994). Order Number DE95751979. Source: OSTI; NTIS (US Sales Only); INIS.

This report contains five articles about experiments on photoproduction at the HERA storage ring. These concern total cross sections, the behavior and the parton structure of the photon, as well as hard scattering in diffractive dissociation of quasi-real photons. (HSI)

11361 (FNAL/C–94/226-E) **A study of parton distribution functions with the use of photon + jet event kinematics in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV.** Hawk, C. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–85: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95005127. Source: OSTI; INIS; NTIS; GPO Dep.

We have measured the leading jet pseudorapidity distribution in photon + jet events selected from the inclusive direct photon event sample. The data are from $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV recorded with CDF in the 1992–1993 run. This measurement has been used to study the behavior of current parton distribution sets in selected kinematic regions. The parton distribution sets CTEQ2M and MRSD0 are currently favored by this measurement.

11362 (FNAL/C–94/408-E) **Preliminary results on the decays $D^+ \rightarrow K^+\pi^+\pi^-$, $D^+ \rightarrow K^+K^+K^-$.** Purohit, M. (Princeton Univ., NJ (United States). Dept. of Physics); Wiener, J. Fermi National

Accelerator Lab., Batavia, IL (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–83: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004865. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results on the Doubly Cabibbo Suppressed Decays (DCSD) $D^+ \rightarrow K^+\pi^+\pi^-$ and $D^+ \rightarrow K^+K^+K^-$ from roughly 40% of the E791 data set are summarized. The authors present an analysis of candidate events from E791 data in these decay modes. They show that there is a clear signal in the $D^+ \rightarrow K^+\pi^+\pi^-$ mode and discuss backgrounds and sources of error in the results. They disagree with a published signal level in the $D^+ \rightarrow K^+K^+K^-$ mode.

11363 (FNAL/C–94/415-E) **B-Physics results from D0.** Hedin, D. (Northern Illinois Univ., De Kalb, IL (United States)); Markosky, L. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940722–42: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95005126. Source: OSTI; NTIS; INIS; GPO Dep.

We report on preliminary measurements of the inclusive single muon and dimuon cross sections in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV using the D0 detector at the Fermilab collider. From these results, we extract the cross section for b-quark production for the kinematic range $|yb| < 1.0$ and $6 < p_t^b < 50$ GeV/c. We also report measurements on the J/ψ production, and correlations between muons in dimuon events.

11364 (GSI–94-65(prepr.)) **π-πscattering lengths at finite temperature.** Quack, E. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Forschungsbereich Theorie); Zhuang, P.; Kalinovsky, Y.; Klevansky, S.P.; Huefner, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Oct 1994. 13p. Order Number DE95746164. Source: OSTI; NTIS (US Sales Only); INIS.

The s-wave π-π scattering lengths $a^I(T)$ at finite temperature T and isospin I=0,2 are calculated within the SU(2) Nambu-Jona-Lasinio model. $a^2(T)$ dislays a singularity at the Mott temperature T_M, defined as $m_\pi(T_M)=2m_q(T_M)$, while $a^0(T)$ is singular in addition at the lower temperature T_d, where $m_\sigma(T_d)=2m_\pi(T_d)$, m_σ and m_π being the masses of the σ and π mesons, respectively. Numerically we find T_d=198 MeV and T_M=215 MeV. We speculate on possible experimental consequences. (orig.)

11365 (GSI–94-69(prepr.)) **Baryon resonances - a primary $\rho \rightarrow l^+l^-$ source in p+p and p+d at 4.9GeV.** Winckelmann, L.A. (Frankfurt Univ. (Germany). Inst. fuer Theoretische Physik); Sorge, H.; Stoecker, H.; Greiner, W. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Oct 1994. 9p. Order Number DE95745905. Source: OSTI; NTIS (US Sales Only); INIS.

Dilepton spectra for p+p and p+d reactions at 4.9 GeV are calculated. We consider electromagnetic bremsstrahlung also in inealstic reactions. N^* and Δ^* decays present the major contributions to the q and ω meson yields. Pion annihilation yields only $\approx$1.5% of all ρ's in p+d. The ρ mass spectrum is strongly distorted due to phase space effects, populating dominantly dilepton masses below 770 MeV. It is found that inclusive production cross sections of ρ, ω and η mesons in p+p are 3-4 times higher than the (measured) exclusive cross sections for pp+meson. This prediction could be checked by measuring the decays of ρ, ω and η mesons into photons. (orig.)

11366 (GSI–94-75(prepr.)) **Quark exchange model for charmonium dissociation in hot hadronic matter.** Martins, K. (Rostock Univ. (Germany). Arbeitsgruppe Theoretische Vielteilchensysteme); Blaschke, D.; Quack, E. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 31p. (MPG-VT-UR–39/94). Order Number DE95745818. Source: OSTI; NTIS (US Sales Only); INIS.

A diagrammatic approach to quark exchange processes in meson-meson scattering is applied to the case of inelastic reactions of the type (Q anti Q)+(q anti q)$\rightarrow$(Q anti q)+(q anti Q), where Q and q refer to heavy and light quarks, respectively. This string-flip process is discussed as a mircoscopic mechanism for charmonium dissociation (absorption) in hadronic matter. The cross section for the reaction $J/\psi+\pi \rightarrow D+$ anti D is calculated using a potential model, which is fitted to the meson mass spectrum. The temperature dependence of the relaxation time for the J/ψ distribution in a homogeneous thermal pion gas is obtained. The use of charmonium for the diagnostics of the state of hot hadronic matter produced in ultrarelativistic nucleus-nucleus collisions is discussed. (orig.)

11367 (GSI–94-76(prepr.)) **Heavy quark production in pp collisions.** Gavai, R.V. (Tata Energy Research Inst., Bombay (India)); Gupta, S.; McGaughey, P.L.; Quack, E.; Ruuskanen, P.V.; Vogt, R. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 57p. Order Number DE95745817. Source: OSTI; NTIS (US Sales Only); INIS.

A systematic study of the inclusive single heavy quark and heavy-quark pair production cross sections in pp collisions is presented for RHIC and LHC energies. We compare with existing data when possible. The dependence of the rates on the renormalization and factorization scales is discussed. Predictions of the cross sections are given for two different sets of parton distribution funtions. (orig.)

11368 (IFVE-OEF–94-6) **Study of the p + N $\rightarrow$ [Σ^0K^+] + N reaction at E_p 70 GeV.** Vavilov, D.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij); Viktorov, V.A.; Golovkin, S.V. SPHINX Collaboration (IFVE - ITEF). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 7p. (In Russian). Order Number DE95619273. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Yadernaya Fizika.

The reaction p + N $\rightarrow$ [Σ^0K^+] + N has been studied at the SPHINX Facility with the IHEP 70 GeV proton beam. In the mass spectrum M[Σ^0K^+] for a coherent diffraction process a distinct peak with the mass M = 1999 $\pm$ 7 MeV and width Γ = 91 $\pm$ 17 MeV is observed alogside with the nearthreshold structure with M $\simeq$ 1800 MeV. 7 refs., 4 figs.

11369 (IFVE-ONF–94-36) **Study of different type neutrino oscillations based on neutrino beams from 600 GeV.** Aref'ev, A.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki); Bezrukov, L.B.; Belolapikov, I.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 24p. (In Russian). Order Number DE95619267. Source: OSTI; NTIS (US Sales Only); INIS.

The problems of the different type neutrino oscillations based on a wide-band and narrow-band neutrino beam from the 600 GeV UNK-1 machine using the Baical Neutrino Telescope (4200 km from a accelerator) are discussed. The main parameters of the neutrino channel are presented. 17 refs.; 12 figs.; 1 tab.

11370 (IHEP–94-3) **Scaling law for the Υ(4S) $\rightarrow$ BB-bar and ψ(3770) $\rightarrow$ DD-bar decay constants from effective sum rules.** Kiselev, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 12p. Order Number DE95620538. Source: OSTI; NTIS (US Sales Only); INIS.

The sum rules for exclusive production of heavy meson pairs in e^+e^- annhilation are used to evaluate the Υ(4S) $\rightarrow$ BB-bar and ψ(3770) $\rightarrow$ DD-bar decay widths. Infinitely heavy quark limit is discussed, and the scaling law for the quarkonium-meson coupling constant is derived. The BB-bar pair contribution into the leptonic constant $f_{\Upsilon(4S)}$ is estimated. 11 refs.

11371 (IHEP–94-10) **Four heavy quark and bound state production in the $e^+e^- \rightarrow$ Q + Q-bar + Q' + Q-bar and $e^+e^- \rightarrow$ (QQ-bar') + Q' + Q-bar processes in Z^0-boson pole.** Kiselev, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij); Likhoded, A.K.; Shevlyagin, M.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 31p. Order Number DE95620533. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Yad. Phys.

In the frame of the QCD perturbation theory and nonrelativistic model of heavy quarkonium the cross-sections of four heavy quark production in e^+e^- annihilation, as well as the cross-sections of the associative production of the 1S- and 2S-wave (QQ-bar′)-mesons in the $e^+e^- \rightarrow$ (QQ-bar′) + Q′+ Q-bar process are calculated. Basing on the assumption of the quark-hadron duality the number of the Λ_{bc}-hyperon expected for LEP experiments is estimated. The fragmentation functions of b-quark into $B_c(B_c^*)$-meson, c- and b-quarks into $\eta_c(\psi)$- and $\eta_b(\Upsilon)$-mesons, respectively, are obtained. 23 refs., 11 figs., 4 tabs.

11372 (IHEP–94-15) **The $\pi \rightarrow e\nu\gamma$ decay in chiral perturbation theory.** Komachenko, Yu.Ya.; Rogalev, R.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 8p. Order Number DE95619269. Source: OSTI; NTIS (US Sales Only); INIS.

We calculate the electromagnetic correction to $\pi \rightarrow e\nu\gamma$ form factors within the Chiral Perturbation Theory. This correction does not explain the discrepancy between the theoretical and experimental spectra of the $\pi \rightarrow e\nu\gamma$ decay. However, the expression we obtain indicates that there exists a tensorial interaction with coupling constant $f_T \approx 10^{-7}$-10^{-6} in the effective weak hamiltonian. We also estimate f_T within the Standard Model. There is a good agreement between the ChPT and SM. 18 refs.; 2 figs.

11373 (IHEP–94-19) **On the search for exotic hadrons in the experiments with high energy hyperon beam.** Landsberg, L.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij); Kubantsev, M.A.; Moinester, M.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 43p. Order Number DE95620534. Source: OSTI; NTIS (US Sales Only); INIS.

The possibilities to search for exotic mesons, baryons and dibaryons in the framework of E781 Fermilab experiment with high energy hyperon and meson beams with momenta of $\approx$ 600 GeV are analyzed. It is shown that there are good possibilities for the observation of different types of exotic hadrons in E781 experiment. 39 refs., 14 figs., 9 tabs.

11374 (IHEP–94-20) **Period doubling dynamics in hadron physics: exact calculations.** Batunin, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 11p. Order Number DE95620535. Source: OSTI; NTIS (US Sales Only); INIS.

Some characteristics of the limit 2^m-cycles and Feigenbaum attractor and their agreement with corresponding (in the framework of a bifurcation model) experimental values are obtained. 17 refs., 4 figs.

11375 (IHEP–94-34) **On possibility to study neutrino oscillations by detectors located at Gran Sasso (Italy) using beams from 600 GeV UNK-1 machine.** Fedotov, Yu.S. (and others); Garkusha, V.I.; Gershctejn, S.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 8p. Order Number DE95619268. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the results of a preliminary consideration of the possibility to form beams from the 600 GeV UNK-1 machine toward Gran Sasso (Italy) laboratory as well as to study neutrino oscillations using the ICARUS facility. Depending on the experiment conditions the expected range for the study of the oscillation parameters is Δm^2 up to 10^{-3} eV^2 under complete mixing and $\sin^2 2\theta$ up to 6×10^{-3} at $\Delta m^2 \approx 2 \times 10^{-2}$ eV^2. 7 refs.; 6 figs.; 2 tabs.

11376 (IHEP–94-48) **Hadronic production of B_c-mesons.** Berezhnoj, A.V. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Shevlyagin, M.V.; Likhoded, A.K. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 23p. Order Number DE95620536. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Yad. Fiz.

On the basis of the exact formulas of QCD perturbation theory and parton model the hadronic production cross-sections for $B_c(B_c^*)$-mesons (1^1S_0, 1^3S_1, 2^1S_0, 2^3S_1-states) are calculated. The method used is the direct calculation of appropriate amplitudes with the help of a FORTRAN program and subsequent Monte-Carlo integration over the phase space and convolution with the structure functions. 17 refs., 22 figs., 3 tabs.

11377 (IHEP–94-52) **Testing vector boson dominance of electroweak interactions via $e^+e^- \rightarrow$ f-barf.** Kabachenko, V.V. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Pirogov, Yu.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 21p. Order Number DE95620528. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Int. J. Mat. Phys.

In the framework of the Vector Boson Dominance (VBD) of electroweak interactions for composite leptons, quarks and Higgs bosons, restrictions on the universal four-fermion contact interactions are investigated. Manifestations of the VBD via these interactions at the 2 TeV e^+e^- linear collider are studied. Definite signatures of the VBD are exposed. It is shown that the VBD could be tested at the collider for the unified substructure scale up to O(50 TeV), which lies well in naturally preferred Deca-TeV region. 12 refs., 8 figs.

11378 (IHEP–94-53) **B_c-meson production in hadron-hadron collisions.** Slabospitskij, S.R. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 21p. Order Number DE95620537. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal, Phys. Rev. D.

The B_c-meson production cross section was calculated in the perturbative QCD. Various distributions of the charged leptons from the $B_c \rightarrow l\nu J/\psi(\rightarrow l^+l^-)$ decay were obtained. The B_c-meson mass measurement from such decays is also discussed. 17 refs., 9 figs., 1 tab.

11379 (IHEP–94-63) **Scaling behaviour of leptonic decay constants for heavy quarkonia and heavy mesons.** Kiselev, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 15p. Order Number DE95620539. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of QCD sum rules one uses a scheme, allowing one to apply the conditions of both nonrelativistic heavy quark motion inside mesons and the heavy quark flavour independence of nonsplitting nS-state density. In the leading order an analitic expression is derived for leptonic constants of both heavy quarkonia and heavy mesons with a single heavy quark. The expression allows one explicitly to determine scaling properties of the constants. 24 refs., 2 tabs.

11380 (IHEP–94-69) **Anomalous di-photon production at LEP: possible consequences at FNAL hadron collider.** Litvin, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij); Slabospitskij, S.R.; Shvorob, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 9p. Order Number DE95620531. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journals, Yad. Fiz., Il Nuovo Cimento.

The hypothetic R-resonance production (anomalous 'll-bar$\gamma\gamma$' events at LEP) with 60 GeV mass at FNAL hadron collider has been considered. The cross-section of this R-resonance production with the consequent decay $R \rightarrow \gamma\gamma$ is obtained. Various distributions of leptons and photons in the process pp-bar $\rightarrow$ ll-bar R ($\rightarrow \gamma\gamma$) X are calculated. 13 refs.

11381 (IPNO-TH–94-36) **On the Pais-Treiman method to measure $\pi\pi$ phase shifts in K_{e4} decays.** Colangelo, G. (Rome Univ. 2 (Italy). Dipt. di Fisica); Knecht, M.; Stern, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. 12p. Contract CHRX-CT920026. Order Number DE95619280. Source: OSTI; NTIS (US Sales Only); INIS.

Theoretical uncertainties of the method of Pais and Treiman to measure the $\pi\pi$ phase shifts in K_{e4} decays are estimated. It has been found that they are very small, below 1%. Newly planned experiments like KLOE at DAΦNE, will hopefully be able to reduce the errors sizeably enough to decide between the theoretical alternatives. In view of this improvement on the experimental side, it is worth to check what kind of uncertainties affect the Pais-Treiman method from the theoretical point of view. (authors). 12 refs., 1 fig.

11382 (JINR–5-62-93, pp. 54-62) **On the reaction pp → ppγ as a means of test for narrow dibaryon structures.** Ershov, S.N.; Gerasimov, S.B.; Khrykin, A.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1993. In *JINR rapid communications. Collection 5.* 73p. Order Number DE95615834. Source: OSTI; NTIS (US Sales Only); INIS.

The location of possible narrow dibaryon resonances in ppγ reaction is discussed.Contributions from the charge (convection) and magnetic (spin) currents of colliding protons are taken into account. It is shown that measurement of the photon energy spectrum is more suitable for observation of possible narrow dibaryon resonances than the widely used detection of all final particles with coplanar momenta. (author). 18 refs., 5 figs.

11384 (JINR-R–2-94-325) **Isgur-Wise Function and Polarization Characteristics of Λ_b-Baryon.** Ivanov, M.A.; Lyubovitskij, V.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 11p. (In Russian). Order Number DE95623696. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Pis'ma v Zhurnal Ehksperimental'noj i Teoreticheskoj Fiziki.

In connection with planned experiments devoted to investigation of semileptonic decays of beauty baryons Isgur-Wise function and polarization characteristics of Λ_b baryon are calculated in the framework of diquark model with taking into account of infrared behaviour of heavy quark. (author). 4 figs., 3 tabs.

11385 (KEK–94-2) **Letter of intent for a study of CP violation in B meson decays.** National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Apr 1994. 201p. Order Number DE95747974. Source: OSTI; NTIS; INIS.

A major unresolved issue in the understanding of the Universe is how the current Universe evolved from the matter-antimatter symmetric Big Bang. CP-violating effects have played a key role in the development of the Universe. Since the Kobayashi-Maskawa hypothesis of six quarks has been substantiated, the K-M model for CP violation is now considered to be an essential part of the Standard Model. Observations indicated that it would be feasible to carry out the decisive tests of the K-M model by studying B meson decay. The observation of CP-violating asymmetry in B meson decay would be the first successful demonstration of a CP-violating effect outside K^0 meson system, and would be the dramatic confirmation of the K-M model. In light of the strong competition in this research, the upgrade of the TRISTAN facility and the construction of a detector must be ready as early as possible. In this letter of intent for the experiment at National Laboratory for High Energy Physics B Factory, the goals of this experiment, detector requirements and optimization, accelerator-detector interface, the reference design, physics simulation, and cost, schedule and organization are described. (K.I.) 140 refs.

11386 (KFKI–1994-19/A) **ALCOR. A dynamic model for hadronization.** Biro, T.S. (Particle and Nuclear Research Inst., Budapest (Hungary)); Levai, P.; Zimanyi, J. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Nov 1994. [18p.] Order Number DE95623688. Source: OSTI; NTIS (US Sales Only); INIS.

We calculate hadron multiplicities in the framework of the Algebraic Coalescence Rehadronization model, which counts for redistribution of quarks into hadrons for relativistic heavy-ion collisions. A dynamical in-medium suppression of the light to heavy quark coalescence factors and the influence of a Bjorken flow on the hadronic composition are incorporated in the model. A comparison with the CERN SPS NA35 heavy ion experiment and prediction for NA49 is presented. (author) 16 refs.; 2 tabs.

11387 (LAPP-EXP–94-07) **LEP asymmetries and fits of the standard model.** Pietrzyk, B. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules Elementaires. 5 May 1994. [8p.] (CONF-9403182–: 29. Recontres de Moriond conference, Meribel (France), 19-26 Mar 1994). Order Number DE95619285. Source: OSTI; NTIS (US Sales Only); INIS.

The lepton and quark asymmetries measured at LEP are presented. The results of the Standard Model fits to the electroweak data presented at this conference are given. The top mass obtained from the fit to the LEP data is 172_{-14-20}^{+13+18} GeV; it is 177_{-11-19}^{+11+18} when also the collider, ν and A_{LR} data are included. (author). 10 refs., 3 figs., 2 tabs.

11388 (MPI-PhE–93-10) **An investigation of Bose-Einstein correlations in muon-nucleon interactions at 490 GeV.** Adams, M.R. (Illinois Univ., Chicago, IL (United States)); Aid, S.; Anthony, P.L. FERMILAB E665 Collaboration. Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut. Apr 1993. 15p. Order Number DE95754171. Source: OSTI; NTIS (US Sales Only); INIS.

An investigation of Bose-Einstein correlations amongst like-charged pions produced in muon-nucleon interactions at 490 GeV is presented. On top of a broader enhancement, a steep increase in the correlations at small four-momentum differences between the two pions is observed which may be explained by the contribution from decays of resonances (ρ-mesons). A two-dimensional analysis discriminates between two different parametrizations of the Bose-Einstein effect, strongly favoring the Lorentz-invariant parametrization over a parametrization based on a Gaussian source distribution in space and time. (orig.)

11389 (MPI-PhE–94-25) **A consistent parametrisation for the production rates of negatively charged hadrons and neutral strange particles in nucleon-nucleon, nucleon-nucleus and nucleus-nucleus collisions.** Kadija, K.; Derado, I.; Schmitz, N.; Seyboth, P. Max-Planck-Institut fuer Physik, Muenchen (Germany). Nov 1994. 34p. Order Number DE95756029. Source: OSTI; NTIS (US Sales Only); INIS.

A parametrisation of negative hadron and neutral strange particle production was developed which consistently describes presently available data from nucleon-nuceon, nucleon-nucleus, and nucleus-nucleus collisions at a beam energy of 200 GeV per nucleon. Average multiplicities of negative hadrons are found to be proportional to the number of wounded nucleons, average K_s^0 multiplicities proportional to the number of wounded quarks, and average Λ and anti Λ multiplicities proportional to the number of wounded quarks plus an additional contribution proportional to the number of interactions of secondary produced particles. Predictions are given for lead-lead collisions. (orig.)

11390 (MPI-PhE–94-26) **The hadronic final state in deep inelastic scattering at HERA.** Lanius, P. Max-Planck-Institut fuer Physik, Muenchen (Germany); Hamburg Univ. (Germany). Fachbereich 12 - Physik. Oct 1994. 105p. Order Number DE95756020. Source: OSTI; NTIS (US Sales Only); INIS.

Global properties of the hadronic final state of deep inelastic scattering events recorded in 1992 with the H1 detector at HERA, are investigated. The data are corrected for detector effects and can be compared directly with QCD phenomenology and calculations based on BFKL dynamics. The measurement of the energy flows in the laboratory frame and in the hadronic centre of mass system reveal large discrepancies between the data and the different model predictions, indicating the failure of models based on Altarelli-Parisi evolution at low χ. However, these energy flow

results are found to agree fairly well with theoretical predictions derived from Lipatov (BFKL) evolution. In the hadronic centre of mass frame the longitudinal and transverse momentum components of charged particles are measured. The longitudinal component exhibits scaling with W and allows comparison with lower energy lepton-nucleon scattering data as well as with e^+e^- data from LEP. For the 1993 data, studies of the charged particle energy spectra in the Breit frame are undertaken. This measurement allows a first tentative look at predictions from the Modified Leading Logarithmic Approximation for the target region, a region that to-date unexplored has been unexplored. (orig.)

11391 (SLAC–446) **Electroweak coupling measurements from polarized Bhabha scattering at the Z^0 resonance.** Pitts, K.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1994. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. Order Number DE95006090. Source: OSTI; NTIS; INIS; GPO Dep.

The cross section for Bhabha scattering ($e^+e^- \rightarrow e^+e^-$) with polarized electrons at the center of mass energy of the Z^0 resonance has been measured with the SLD experiment at the Stanford Linear Accelerator Center during the 1992 and 1993 runs. The electroweak couplings of the electron are extracted. At small angles the measurement is done in the SLD Silicon/Tungsten Luminosity Monitor (LMSAT). A detailed description of the design, construction, commissioning and operation of the LMSAT is provided. The integrated luminosity for 1992 is measured to be $L = 420.86 \pm 2.56$ (stat) ± 4.23 (sys) nb^{-1}. The luminosity asymmetry for polarized beams is measured to be $A_{LR}(LUM) = (1.7 \pm 6.4) \times 10^{-3}$. The large angle polarized Bhabha scattering reveals the effective electron vector and axial vector couplings to the Z^0 through the measurement of the $Z^0 \rightarrow e^+e^-$ partial width, Γ_{ee}, and the parity violation parameter, A_e. From the combined 1992 and 1993 data the effective electron vector and axial vector couplings are measured to be $\bar{g}_v^e = -0.0495 \pm 0.0096 \pm 0.0030$, and $\bar{g}_a^e = -0.4977 \pm 0.0035 \pm 0.0064$ respectively. The effective weak mixing angle is measured to be $\sin^2\theta_W^{eff} = 0.2251 \pm 0.0049 \pm 0.0015$. These results are compared with other experiments.

11392 (DESY–94-148) **Bounds on radii and magnetic dipole moments of quarks and leptons from LEP, SLC and HERA.** Koepp, G. (Technische Hochschule Aachen (Germany). Lehrstuhl fuer Experimentalphysik 3A und 3. Physikalisches Inst.); Schaile, D.; Spira, M.; Zerwas, P.M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 13p. Order Number DE95745808. Source: OSTI; NTIS (US Sales Only); INIS.

Leptons, quarks and gauge bosons are assumed to be pointlike particles in the Standard Model. Stringent bounds on the radii of quarks and leptons and their weak anomalous magnetic moments can be derived from the high-precision measurements at LEP and SLC. We find a model-independent bound of $R <$ or $\approx 10^{-17}$ cm for quark and lepton radii. HERA will provide complementary information on the electromagnetic static properties of the quarks and the parameters of the charged quark currents. (orig.)

11393 (DESY–94-166) **The $(0^+,1^+)$ heavy meson multiplet in an extended NJL model.** Ebert, T. (Humboldt-Universitaet, Berlin (Germany). Inst. fuer Physik); Feldmann, T.; Friedrich, R.; Reinhardt, H. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 14p. (HUB-IEP–94/14). Order Number DE95746148. Source: OSTI; NTIS (US Sales Only); INIS.

In this letter we reconsider the previously given description of heavy mesons with a bosonized extended NJL model that combines heavy quark and chiral symmetry. In that work the naive gradient expansion of the quark determinant was used, which satisfactorily works in the light sector but does not adequately describe the heavy $(0^+, 1^+)$ mesons. By investigating the exact momentum dependence of the quark loop we demonstrate that the naive gradient expansion in the heavy sector is not the right method to treat the unphysical q anti q-thresholds which would be absent in confining theories. We propose a modified gradient expansion which adequately extrapolates from the low-momentum region beyond threshold. This expansion gives a satisfactory description even of the $(0^+, 1^+)$ heavy mesons whose masses are significantly above threshold. (orig.)

11394 (DOE/ER/40757–057) **Signatures of Higgs-Triplet representations at TeV-e^+e^- colliders.** Cheung, Kingman (Univ. of Texas, Austin, TX (United States). Center for Particle Physics); Phillips, R.J.N.; Pilaftsis, A. Texas Univ., Austin, TX (United States). Center for Particle Physics. Nov 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER40757. (RAL–94-119). Order Number DE95007201. Source: OSTI; NTIS; INIS; GPO Dep.

The authors investigate the potential of future TeV linear e^+e^- colliders to observe singly-charged Higgs bosons ($H^\pm$) via the coupling $H^\pm W^\mp Z$, which would signal the existence of exotic Higgs representations. In the context of a Higgs-triplet model compatible with the electroweak oblique parameters, they estimate the cross section for producing charged Higgs-triplet bosons that couple predominantly to W and Z bosons in 0.5-2 TeV-e^+e^- colliders. The principal backgrounds are evaluated and the viability of the signal is discussed and illustrated.

11395 (FNAL/C–94/238-E) **Studies of kinematic distributions and mass reconstruction of CDF top candidate events.** Harral, B.D. (Pennsylvania Univ., Philadelphia, PA (United States). Dept. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–87: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95005108. Source: OSTI; INIS; NTIS; GPO Dep.

We present analyses of CDF top-candidate events which study the separation of signal from background using easily-defined kinematic variables, and which study invariant masses of three-body systems to fully reconstruct the top quark decay products.

11396 (FNAL/C–94/401) **Excited Charm States.** Shukla, S. Fermi National Accelerator Lab., Batavia, IL (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410285–2: 2. international workshop on heavy quark physics in fixed targets, Charlottesville, VA (United States), 6-10 Oct 1994). Order Number DE95005749. Source: OSTI; NTIS; INIS; GPO Dep.

Characteristics of mass spectra and decays of orbitally excited charm mesons and baryons, expected on the basis of quark models and Heavy Quark Symmetry, are briefly described. The difficulties associated with measurements on these excited states are discussed. The accuracy and reliability of currently available experimental information is examined. The reasons, for the widely accepted spin-parity assignments to the observed excited mesons and baryons, are stated. Finally, the experimental data, with the accepted spin-parity assignments, is compared with expectations based on quark models and Heavy Quark Symmetry.

11397 (IHEP–93-5) **Search for heavy pentaquark exotic baryons with hidden strangeness in the reactions $p + N \rightarrow (p\phi) + N$ and $p + N \rightarrow [\Lambda(1520)K^+] + N$ at $E_p = 70$ GeV.** Balatz, M.Ya. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki); Belyaev, I.M.; Dorofeev, V.A. SPHINX Collaboration (IHEP - ITEP). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1993. 20p. Order Number DE95619292. Source: OSTI; NTIS (US Sales Only); INIS.

In the experiments at the SPHINX facility on the 70 GeV proton beam of the IHEP accelerator a wide program of studying of the baryon diffractive production and search for exotic baryons in these processes is being carried out. The first data for the reactions $p + N \rightarrow (K^+K^-p) + N$, $p + N \rightarrow (p\phi) + N$ and $p + N \rightarrow [\Lambda(1520)K^+] + N$ are presented. The very sensitive upper limits for the cross sections for diffractive production of heavy narrow cryptoexotic baryon

resonances with hidden strangeness in the mass region up to 4.5 GeV are obtained. 14 refs., 12 figs., 2 tabs.

11398 (IHEP–93-149) **Do the narrow cryptoexotic baryon resonances exist ?.** Landsberg, L.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1993. 11p. Order Number DE95619291. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of the existence of the cryptoexotic baryons —qqqcc-bar> with hidden charm and with mass, smaller than $\simeq$4 GeV, is discussed. Only OZI suppressed baryon decays can occure in the case. These baryons would have anomalously narrow decay widths. Possible production and decay mechanism for exotic baryons of this kind are considered as well as the perspectives of their experimental searches. 13 refs., 6 figs.

11399 (IHEP–94-56) **Double charmed baryons production at B-factory.** Kiselev, V.V.; Likhoded, A.K.; Shevlyagin, M.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 6p. Order Number DE95620540. Source: OSTI; NTIS (US Sales Only); INIS.

The cross-section for the double charmed baryon production at a B-factory is estimated on the basis of the perturbative QCD calculations as well as of the quark-hadron duality for the cc-diquark production. 14 refs., 6 figs., 2 tabs.

11400 (IHEP-OEF–93-97) **Search for N_ϕ(1960) baryon.** Balatz, M.Ya. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki); Belyaev, I.M.; Dorofeev, V.A. SPHINX Collaboration (IHEP - ITEP). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1993. 15p. Order Number DE95619290. Source: OSTI; NTIS (US Sales Only); INIS.

In the experiments at the SPHINX facility in the 70 GeV proton beam of the IHEP accelerator the diffractive production reactions p + N $\rightarrow$ [$\Sigma(1385)^0K^+$] + N and p + N $\rightarrow$ [$\Sigma(1385)^0K^+$] + N + (neutral particles) were studied. In the effective mass spectra of the [$\Sigma(1385)^0K^+$] system in these processes there were no signals from the anomalously narrow baryon state N_ϕ(1960), which had been observed earlier in the measurement at the BIS-2 setup. 6 refs., 7 figs.

11401 (LAPP-EXP–94-08) **Neutrino oscillation at reactors.** Declais, Y. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules Elementaires. Jun 1994. [18p.] (CONF-9402125–: 6. International workshop on neutrino telescopes, Venice (Italy), Feb 1994). Order Number DE95619300. Source: OSTI; NTIS (US Sales Only); INIS.

Latest results from reactor experiments are reported. Experiments conducted at the Bugey 3 and 4 reactors to record neutrino energy spectra at various distances from the neutrino source are presented. Other reactor neutrino results are also reported. Ultimate accuracy has been obtained in neutrino oscillation search at distances up to 100 m. Future plans are discussed. (R.P.). 21 refs., 7 figs., 7 tabs.

11402 (LA-UR–94-4124) **Neutral current neutrino-nucleon scattering.** Garvey, G.T. Los Alamos National Lab., NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409270–2: 3. school on astrofundamental physics, Erice (Italy), 15-22 Sep 1994). Order Number DE95005027. Source: OSTI; NTIS; INIS; GPO Dep.

It may appear unusual to have a contribution on neutrino scattering at a school devoted to electromagnetic probes, as the neutrino has no known electromagnetic couplings. However, as a means to examine the hidden flavor currents in the nucleon, the recent results observed for the spin structure function of the nucleon have focused attention on the nucleon's neutral weak currents (NWC). When an electromagnetic probe is scattered elastically from a nucleon, the NWC interactions are observable only through the detection of very small ($> 10^{-6}$) parity-violating processes. In the case of neutrino scattering, the NWC is the dominant coupling. In what follows it will be shown how the nucleon's vector and axial vector form factors arising from strange quark currents can be measured via neutrino elastic scattering. Preliminary results from the Large Scintillation Neutrino Detector (LSND) at LAMPF will be presented as well as a recent analysis of an earlier experiment (E734) carried out at Brookhaven.

11403 (SLAC–451) **The Tau-Charm Factory in the ERA of B-Factories and CESR.** Beers, L.V.; Perl, M.L. (eds.). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. 784p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is a collection of presentations made at a conference on tau-charm factories, held at the Stanford Linear Accelerator Center and Stanford University on August 15-16, 1994. The papers presented summarize the physics which can be learned from such a facility, the advantages it would present over planned B-factories and large centers such as CESR, and the types of decay modes which could be observed. More detailed studies of tau physics are opened up, as well as charmonium and charmed systems. Seperate presentations to the proceedings are indexed individually into the database.

11404 (SLAC-PUB–95-6741) **Extended gauge sectors.** Rizzo, T.G. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-941251–1: 4. international conference on physics beyond the standard model, Lake Tahoe, CA (United States), 13-18 Dec 1994). Order Number DE95006485. Source: OSTI; NTIS; INIS; GPO Dep.

Present and future prospects for the discovery of new gauge bosons, Z′ and W′, are reviewed. Particular attention is paid to hadron and e^+e^- collider searches for the W′ of the Left-Right Symmetric Model.

Source: OSTI; NTIS (US Sales Only); INIS.

This report has been prepared to promote the exchange of nuclear data research information between the Federal Republic of Germany and other member states of OECD/NEA and IAEA. It covers progress reports from KfK Karlsruhe, KFA Juelich, the universities of Dresden, Hannover, Koeln, Mainz, Marburg as well as from PTB Braunschweig and FIZ Karlsruhe. The emphasis in the

work reported here is on measurement, compilation and evaluation of nuclear data for pure and applied science programmes, such as those relevant to fission- and fusion-reactor technology, radioactive waste management, accelerator shielding and development, astrophysics research, cosmogenic and meteoritic investigations, production of medically important radioisotopes, etc. Each contribution is presented under the laboratory heading from where the work is reported. The names of other participating laboratories are also mentioned. When the work is relevant to the World Request List for Nuclear Data, WRENDA 87/88 (INDC(SEC)-095/URSF), the corresponding identification numbers are given. (orig.)

Under Hadrons in Nuclei and Nuclear Matter the authors research the ways in which the properties of nucleons and mesons are modified in the nuclear medium. Research progress is reported on a number of topics in this general area, including studies of the role of chiral symmetry for finite density or temperature nuclear matter, the use of QCD sum rules to describe baryons in nuclear matter, and color transparency. In the general field of Hadron Physics broad progress included studies of perturbative QCD, heavy quark physics, QCD sum rules, and QCD-based models. Notable progress was also achieved in Relativistic Dynamics in Quark, Hadron, and Nuclear Physics, where an explicit model of composite particles shows how the z-graph physics (which is an essential part of Dirac phenomenology) comes about. In addition, calculations of elastic electron-deuteron scattering based on two-body relativistic dynamics and meson exchange currents were completed, as were studies of quark-anti-quark bound states based on a relativistic quark model. Progress is also reported on the relativistic few-body problem. In the area of Heavy Ion Dynamics and Sharp Lepton Pairs, work continues on the Composite Particle Scenario for the 'Sharp Lepton Problem'. In particular, the scenario can now encompass the anomalous sharp leptons reported from positron irradiation of heavy neutral atoms, establishing such irradiations as an alternative experimental window to the heavy ion experiments.

11409 (FZR–59(prepr.)) **Tilted cranking.** Frauendorf, S.; Meng, J.; Reif, J. Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Kern- und Hadronenphysik. Oct 1994. 13p. (CONF-9408213–: Conference on physics from large gamma-ray detector arrays, Berkeley, CA (United States), 2-6 Aug 1994). Order Number DE95752093. Source: OSTI; NTIS (US Sales Only); INIS.

The Tilted Axis Cranking theory is used to describe the coexistence of high and low K bands in yrast spectra of well deformed nuclei, magnetic rotation of transitional nuclei and to calculate the parameters of a rotational hamiltonian with a fourfold symmetry axis that generates $\Delta I=4$ staggering in the yrast band. (orig.)

11410 (FZR–60(prepr.)) **Resonance phenomena at high level density.** Sobeslavsky, E. (Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Kern- und Hadronenphysik); Dittes, F.M.; Rotter, I. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). Nov 1994. 13p. Order Number DE95752138. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate the behaviour of resonances as a function of the coupling strength between bound and unbound states on the basis of a simple S-matrix model. Resonance energies and widths are calculated for well isolated, overlapping and strongly overlapping resonance states. The formation of shorter and longer time scales (trapping effect) is traced. We illustrate that the cross section results from an interference of all resonance states in spite of the fact that their lifetimes may be very different. (orig.)

11411 (GSI–94-66(prepr.)) **Gamow-Teller strength distribution in the beta-decay of ^{100}Ag from total-absorption gamma spectrometry.** Batist, L. (St. Petersburg Inst. of Nuclear Physics, Gatchina (Russian Federation)); Bykov, A.; Moroz, F.; Wittmann, V.; Alkhazov, G.D. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Oct 1994. 10p. Order Number DE95746163. Source: OSTI; NTIS (US Sales Only); INIS.

The EC/β^+-decay of the odd-odd nucleus ^{100}Ag was studied by means of total absorption γ-ray spectrometry. Most of the Gamow-Teller strength was found to be concentrated at an excitation energy of 5.6 MeV in ^{100}Pd, the FWHM of this resonance being 1.5 MeV. The measured strength distribution which is interpreted within the BCS approximation as being due to the dominant population of four-quasiparticle excitations, resembles the distribution predicted by an advanced shell-model calculation for the ^{98}Ag→^{98}Cd decay. (orig.)

11412 (GSI–94-87(prepr.)) **Chaos in axially symmetric nuclear potential with diffuse surface and spin-orbit coupling.** Murat, R. (Uniwersytet Marii Curie-Sklodowskiej, Lublin (Poland). Dept. of Theoretical Physics); Rozmej, P. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 17p. Order Number DE95755772. Source: OSTI; NTIS (US Sales Only); INIS.

The results for the classical single-particle motion in Woods-Saxon potential with octupole deformation including spin-orbit interaction are reported. The dependence of the results on the potential diffuseness and on the spin-orbit coupling is studied. The model is examined by means of qualitative (Poincare sections) and quantitative (Lyapunov exponents, power spectrum) methods. The transition from order to chaos is observed when the spin-orbit coupling increases. The role of the diffuseness of the potential in suppressing chaos is also shown. (orig.)

11413 (GSI–94-90(prepr.)) **Hydrodynamic evolution of chirally symmetric nuclear matter.** Navarra, F.S. (Sao Paulo Univ., Sao Carlos (Brazil). Dept. de Fisica); Ornik, U. 11416 (IN2P3–94-02, pp. 2) **Symmetry-breaking in simple one and two level models.** Alexa, P. (Muenchen Univ. (Germany). Sektion Physik); Nosek, D.; Kvasil, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NUCLEAR MODELS/symmetry breaking; DEFORMED NUCLEI; ENERGY LEVELS; MANY-BODY PROBLEM; MEAN-FIELD THEORY; OCTUPOLES; QUADRUPOLES

11417 (IN2P3–94-02, pp. 4) **The triaxial asymmetry of the ground states of even-even nuclei with A≤192.** Andrejtscheff, W. (Bulgarian Academy of Sciences, Sofia (Bulgaria). Inst. for Nuclear Research and Nuclear Energy); Petkov, P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NUCLEAR STRUCTURE/even-even nuclei; NUCLEAR STRUCTURE/ground states; ASYMMETRY; DEFORMED NUCLEI; QUADRUPOLE MOMENTS; SUM RULES

11418 (IN2P3–94-02, pp. 7) **Two proton high-spin excitations and oblate dipole bands in ^{192}Hg.** Astier, A. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire); Beraud, R.; Duffait, R.; Le Coz, Y.; Meyer, M.; Redon, N.; Deloncle, I.; Gall, B.; Kaci, M.; Azaiez, F. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. MERCURY 192/excited states; ANNUAL VARIATIONS; DIPOLES; ENERGY-LEVEL TRANSITIONS; HARTREE-FOCK METHOD

11419 (IN2P3–94-02, pp. 11) **Realistic effective interactions for shell-model calculations.** Barrett, B.R. (Arizona Univ., Tucson, AZ (United States). Dept. of Physics); Zheng, D.C.; Vary, J.P.; McCarthy, R.J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. Grant PHY-9103011; Grant DE-FG02-87ER-40371. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SHELL MODELS/g matrix; EXCITATION; NUCLEAR CORES; PERTURBATION THEORY

11420 (IN2P3–94-02, pp. 13) **The structure of exotic or highly rotating nuclei and the spin-isospin dependence of LDM parameters.** Bencheikh, K. (Setif Univ., Algiers (Algeria). Dept. of Physics); Quentin, P.; Bartel, J.; Chabanat, E. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. HADRONIC ATOMS/liquid drop model; HADRONIC ATOMS/nuclear structure; ROTATIONAL STATES/liquid drop model; ROTATIONAL STATES/nuclear structure; ISOSPIN; SPIN; STRUTINSKY THEORY; THOMAS-FERMI MODEL

11421 (IN2P3–94-02, pp. 16) **Nuclear moments and charge radius of the high-spin isomer ^{178m2}Hf from laser spectroscopy.** Boos, N. (Mainz Univ. (Germany). Inst. fuer Physik); Krieg, M.; Huber, G.; Le Blanc, F.; Lunney, M.D.; Hussonnois, M.; Constantinescu, O.; Pinard, J.; Le Du, D. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. HAFNIUM 178/nuclear magnetic moments; HAFNIUM 178/nuclear radii; ISOMERIC NUCLEI; LASER SPECTROSCOPY; YRAST STATES

11422 (IN2P3–94-02, pp. 17) **G-factor of the low-lying SD band in ^{133}Nd.** Brandolini, F. (Padua Univ. (Italy). Dipt. di Fisica Galileo Galilei); Pavan, P.; Medina, N.H.; Bazzacco, D.; Burch, R.; Menegazzo, R.; Ribas, R.V.; Rossi-Alvarez, C.; Ionescu-Bujor, M.; De Poli, M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NEODYMIUM 133/gyromagnetic ratio; DEFORMED NUCLEI; EXCITED STATES

11423 (IN2P3–94-02, pp. 19) **Laser spectroscopy of neutron deficient bismuth isotopes in a gas cell.** Campbell, P. (Manchester Univ. (United Kingdom). Schuster Lab.); Billowes, J.; Behr, J.; Gwinner, G.; Sprouse, G.D.; Xu, F. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. BISMUTH 202/laser spectroscopy; BISMUTH 203/laser spectroscopy; BISMUTH 204/laser spectroscopy; CHARGE DISTRIBUTION; DEFORMED NUCLEI; GROUND STATES; ISOTONIC NUCLEI; NUCLEAR ELECTRIC MOMENTS; NUCLEAR MAGNETIC MOMENTS

11424 (IN2P3–94-02, pp. 20) **Nuclear shapes and shape changes. Magnetic dipole sum rules as a new signature.** De Coster, C. (Gent Univ. (Belgium). Inst. for Theoretical Physics); Heyde, K. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NUCLEAR MAGNETIC MOMENTS/sum rules; NUCLEAR STRUCTURE/shape; COLLECTIVE EXCITATIONS; DEFORMED NUCLEI; DIPOLE MOMENTS; ENERGY LEVELS; SHAPE

11425 (IN2P3–94-02, pp. 21) **Mean field description of the $I^{\pi}=16^{+}$ isomer in ^{178}Hf.** Girod, M. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Berger, J.F.; Delaroche, J.P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. HAFNIUM 178/hartree-fock-bogolyubov theory; HAFNIUM 178/isomeric nuclei; GROUND STATES; MEAN-FIELD THEORY; NUCLEAR ELECTRIC MOMENTS; NUCLEAR MAGNETIC MOMENTS; NUCLEAR RADII; NUCLEAR STRUCTURE

11426 (IN2P3–94-02, pp. 22) **Self-consistent cranking HFB calculations with the Gogny force for superdeformed bands in nuclei of the A=150 and 190 mass regions.** Girod, M. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Delaroche, J.P.; Berger, J.F.; Libert, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies,

Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SUPERDEFORMED NUCLEI/hartree-fock-bogolyubov theory; SUPERDEFORMED NUCLEI/rotational states; MOMENT OF INERTIA; NUCLEAR STRUCTURE; PAIRING INTERACTIONS; SELF-CONSISTENT FIELD; YRAST STATES

11427 (IN2P3–94-02, pp. 23) **Hartree-Fock-Bogoliubov and configuration mixing calculations of isotope shifts for Kr, Sr, Zr and Hg isotopes.** Delaroche, J.P. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Girod, M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. KRYPTON ISOTOPES/spectral shift; MERCURY ISOTOPES/spectral shift; STRONTIUM ISOTOPES/spectral shift; ZIRCONIUM ISOTOPES/spectral shift; CONFIGURATION MIXING; GROUND STATES; HARTREE-FOCK-BOGOLYUBOV THEORY

11428 (IN2P3–94-02, pp. 25) **A microscopic description of the deformation properties in even-A platinum isotopes.** Deloncle, I. (Paris-11 Univ., 91 - Orsay (France). Centre de Spectrometrie Nucleaire et de Spectrometrie de Masse); Ibrahim, F.; Le Blanc, F.; Libert, J.; Quentin, P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. PLATINUM ISOTOPES/deformed nuclei; ADIABATIC APPROXIMATION; DENSITY MATRIX; HAMILTONIANS; PAIRING INTERACTIONS; SKYRME POTENTIAL

11429 (IN2P3–94-02, pp. 26) **Collective states and transitions in nuclei with quadrupole and octupole deformations.** Denisov, V.Yu. (AN Ukrainskoj SSR, Kiev (Ukraine). Institute for Nuclear Research); Dzyublik, A.Ya. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/rotational states; COLLECTIVE EXCITATIONS; ELECTRIC DIPOLE MOMENTS; ENERGY-LEVEL TRANSITIONS; POLARIZATION; QUADRUPOLE MOMENTS

11430 (IN2P3–94-02, pp. 27) **Simple model of giant isoscalar resonances in nucleus with neutron halo.** Denisov, V.Yu. (AN Ukrainskoj SSR, Kiev (Ukraine). Institute for Nuclear Research). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. GIANT RESONANCE/neutron density; ENERGY-LEVEL TRANSITIONS; EXCITED STATES; HYDRODYNAMIC MODEL; NUCLEAR STRUCTURE; SUM RULES

11431 (IN2P3–94-02, pp. 28) **Search for shape isomeric states in even even nuclei with masses A<100.** Dessagne, Ph. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Miehe, Ch.; Bernas, M.; Fortier, S.; Maison, J.M.; Lepretre, A.; Lucas, R.; Paya, D.; Phan, X.M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SUPERDEFORMED NUCLEI/isomeric nuclei; CHROMIUM 48; CROSS SECTIONS; EXCITED STATES; IRON 52

11432 (IN2P3–94-02, pp. 29) **Shape coexistence in Z=65 nuclei evolution of the deformation along the high spin states of $^{146-149}$Tb.** Dionisio, J.S. (Paris-11 Univ., 91 - Orsay (France). Centre de Spectrometrie Nucleaire et de Spectrometrie de Masse); Schueck, C.; Vieu, Ch.; Popescu, D.G.; Meliani, Z.; Alioui, N.; Amzal, N.; Bendjaballah, N.; Duchene, G.; Merdinger, J.C. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. TERBIUM 146/nuclear structure; TERBIUM 147/nuclear structure; TERBIUM 148/nuclear structure; TERBIUM 149/nuclear structure; DEFORMED NUCLEI; EXCITED STATES; HIGH SPIN STATES

11433 (IN2P3–94-02, pp. 30) **Magnetic properties of superdeformed nuclei around ^{192}Hg and their neutron and proton single particle configurations.** Duprat, J. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Azaiez, F.; Bourgeois, C.; Aiche, M.; Bastin, G.; Deloncle, I.; Astier, A.; Duffait, R.; Beausang, C.W.; Clark, R.M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SUPERDEFORMED NUCLEI/mercury 193; SUPERDEFORMED NUCLEI/thallium 194; SUPERDEFORMED NUCLEI/thallium 195; BRANCHING RATIO; MEAN-FIELD THEORY; MERCURY 192; M1-TRANSITIONS; ROTATIONAL STATES

11434 (IN2P3–94-02, pp. 31) **High-spin yrast isomers in the odd-odd, N=85, ^{152}Ho nucleus.** Foin, C. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires); Andre, S.; Santos, D.; Barneoud, D.; Genevey, J.; Vieu, Ch.; Dionisio, J.S.; Schueck, C.; Meliani, Z.; Pautrat, M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. HOLMIUM 152/high spin states; HOLMIUM 152/yrast states; ENERGY-LEVEL TRANSITIONS; ISOMERIC NUCLEI; NUCLEAR STRUCTURE

11435 (IN2P3–94-02, pp. 32) **Search for deformation effects in heavy nuclei, N<126, Z>82.** Freeman, S.J. (Manchester Univ. (United Kingdom). Schuster Lab.); Bearden, I.G.; Carpenter, M.P.; Davids, C.N.; Henry, R.G.; Janssens, R.V.F.; Lauritsen, T.; Blumenthal, D.J.; Chowdhury, P.; Crowell, B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/radon isotopes; ENERGY-LEVEL TRANSITIONS; EXCITED STATES; FRANCIUM ISOTOPES; RADIUM ISOTOPES

11436 (IN2P3–94-02, pp. 33) **Beta decay study of the very neutron-deficient ^{127}Pr nucleus systematics of low-energy states of odd-A Ce.** Genevey, J. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires); Gizon, A.; Inchaouh, J.; Barneoud,

D.; Foin, C.; Beraud, R.; Emsallem, A.; Bucurescu, D.; Cata-Danil, G.; Egidy, T. von. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CERIUM 127/beta decay; CERIUM 127/energy levels; PRASEODYMIUM ISOTOPES/beta decay; PRASEODYMIUM ISOTOPES/energy levels; HALF-LIFE; QUASI PARTICLES

11437 (IN2P3–94-02, pp. 34) **Gamma-ray and electron spectroscopy of vibrational states in even-even cerium isotopes.** Gizon, A. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires); Inchaouh, J.; Barneoud, D.; Genevey, J.; Plochocki, A.; Penev, I.; Bucurescu, D.; Cata-Danil, G.; Liang, C.F.; Paris, P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CERIUM 128/vibrational states; CERIUM 130/vibrational states; CERIUM 132/vibrational states; ELECTRON SPECTROSCOPY; ENERGY-LEVEL TRANSITIONS; GAMMA SPECTROSCOPY; NUCLEAR STRUCTURE

11438 (IN2P3–94-02, pp. 37) **Projected mean field description of nuclear shapes, moments and complex spectra.** Hammaren, E. (Jyvaeskylae Univ. (Finland). Dept. of Physics); Petrovici, A.; Schmid, K.W.; Faessler, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NUCLEAR STRUCTURE/mean-field theory; DEFORMED NUCLEI; ENERGY-LEVEL TRANSITIONS; EXCITED STATES; MOMENT OF INERTIA; MULTIPOLES

11439 (IN2P3–94-02, pp. 38) **Rotational bands in ^{77}Rb at very high spins.** Harder, A. (Goettingen Univ. (Germany)); Kabadiyski, M.K.; Lieb, K.P.; Rudolph, D.; Gross, C.J.; Nazarewicz, W.; Cunningham, B.; Hannachi, F.; Simpson, J.; Warner, D.D. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RUBIDIUM 77/rotational states; DEFORMED NUCLEI; ENERGY LEVELS; HIGH SPIN STATES; MOMENT OF INERTIA

11440 (IN2P3–94-02, pp. 41) **'Shears bands' in Pb nuclei. A new nuclear structure effect.** Huebel, H. (Bonn Univ. (Germany). Inst. fuer Strahlen- und Kernphysik); Baldsiefen, G.; Chmel, S.; Korten, W.; Neffgen, M.; Pohler, W.; Severen, U.J. van; Willsau, P.; Frauendorf, S.; Grawe, H. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LEAD ISOTOPES/m1-transitions; LEAD ISOTOPES/nuclear structure; COLLECTIVE EXCITATIONS; E2-TRANSITIONS; M1-TRANSITIONS; ROTATIONAL STATES

11441 (IN2P3–94-02, pp. 42) **Is a shape coexistence present in ^{184}Au.** Ibrahim, F. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Barneoud, D.; Cata-Danil, G.; Blachot, J.; Genevey, J.; Gizon, A.; Beraud, R.; Duffait, R.; Emsallem, A.; Deloncle, I. Paris-11 Univ., 91 - Orsay (France). Short communication. MOLYBDENUM ISOTOPES/beta decay; PALLADIUM ISOTOPES/beta decay; RUTHENIUM ISOTOPES/beta decay; ZIRCONIUM ISOTOPES/beta decay; DEFORMED NUCLEI; GAMOW-TELLER RULES; HALF-LIFE; NUCLEAR STRUCTURE

11445 (IN2P3–94-02, pp. 48) **Levels in ^{168}Er above 2 MeV and the onset of chaos.** Boerner, H.G. (Institut Max von Laue - Paul Langevin (ILL), 38 - Grenoble (France)); Jungclaus, A.; Casten, R.F.; Gill, R.L. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. Contract DE-AC02-76CH00016. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ERBIUM 168/energy levels; COINCIDENCE METHODS; DEFORMED NUCLEI; NUCLEAR STRUCTURE

11446 (IN2P3–94-02, pp. 49) **Electromagnetic moments of seniority v=4,6 states in ^{90}Mo.** Kabadiyski, M.K. (Goettingen Univ. (Germany). 2. Physikalisches Inst.); Weiszflog, M.; Harder, A.; Lieb, K.P.; Rudolph, D.; Billowes, J.; Altmann, J.; Burkard, T.; Dewald, A.; Eberth, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear*

structure at low excitation energies. Abstracts of contributed papers. [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. MOLYBDENUM 90/magnetic moments; ARGON 36 REACTIONS; CHLORINE 35 REACTIONS; HIGH SPIN STATES; NICKEL 58 TARGET; PROTONS; SHELL MODELS; WAVE FUNCTIONS

11447 (IN2P3–94-02, pp. 50) **NEET revisited in connection with the resonance radiative pumping of Th-229m.** Karpeshin, F.F. (St. Petersburg Univ. (Russian Federation). Inst. of Physics); Band, I.M.; Trzhaskovskaya, M.B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. EXCITED STATES/energy-level transitions; EXCITED STATES/thorium 229; ELECTRON BEAM PUMPING; HARTREE-FOCK METHOD; INTERNAL CONVERSION; RESONANCE ABSORPTION

11448 (IN2P3–94-02, pp. 51) **Hexadecapole moments of the nuclei and ternary fission at low energies.** Karpeshin, F.F. (St. Petersburg Univ. (Russian Federation). Inst. of Physics); Solyakin, G.Ye. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. TERNARY FISSION/vibrational states; COLLECTIVE EXCITATIONS; LIQUID DROP MODEL; MULTIPOLES; QUADRUPOLE MOMENTS

11449 (IN2P3–94-02, pp. 52) **Nanosecond isomers in ^{89}Nb, ^{89}Mo and ^{91}Tc.** Kast, D. (Goettingen Univ. (Germany). 2. Physikalisches Inst.); Gross, C.J.; Lieb, K.P.; Rudolph, D.; Schubart, R.; Grawe, H.; Heese, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. MOLYBDENUM 89/lifetime; NIOBIUM 89/lifetime; TECHNETIUM 91/lifetime; EXPERIMENTAL DATA; HIGH SPIN STATES; ISOMERIC NUCLEI; LIFETIME; ROTATIONAL STATES; YRAST STATES

11450 (IN2P3–94-02, pp. 54) **Do there exist 'true' SU(5) nuclei.** Kern, J. (Fribourg Univ. (Switzerland). Inst. de Physique). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CADMIUM 112/nuclear structure; CADMIUM 112/su-5 groups; CONFIGURATION MIXING; ENERGY LEVELS

11451 (IN2P3–94-02, pp. 55) **Seniority-inverted yrast states in N=84 nuclei above gadolinium.** Zhang, C.T. (Forschungszentrum Juelich GmbH (Germany). Inst. fuer Kernphysik); Kleinheinz, P.; Collatz, R.; Piiparinen, M.; Sletten, G. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ERBIUM 152/yrast states; HOLMIUM 151/yrast states; THULIUM 153/yrast states; YTTERBIUM 154/yrast states; ENERGY-LEVEL TRANSITIONS; SHELL MODELS

11452 (IN2P3–94-02, pp. 57) **Shape transitions in proton-neutron systems.** Kuyucak, S. (Australian National Univ., Canberra, ACT (Australia). Dept. of Theoretical Physics). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. COLLECTIVE MODEL/deformed nuclei; ANGULAR MOMENTUM; BOSON-EXCHANGE MODELS; HEXADECAPOLES; MEAN-FIELD THEORY; PROTON-NEUTRON INTERACTIONS; QUADRUPOLES

11453 (IN2P3–94-02, pp. 58) **Constants of usual pairing force for nuclei far removed from valley of beta-stability.** Kuzmenko, N.K. (Russian Academy of Sciences, St. Petersburg (Russian Federation). Khlopin Radium Inst.); Mikhajlov, V.M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. PAIRING ENERGY/pairing interactions; BETA DECAY; ENERGY LEVELS; STRUTINSKY THEORY

11454 (IN2P3–94-02, pp. 61) **New nuclides near the deformed shells N=162 and Z=108.** Lazarev, Yu.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/heavy nuclei; ALPHA DECAY; CURIUM 248 TARGET; GROUND STATES; HALF-LIFE; MAGIC NUCLEI; NEON 22 REACTIONS; STABLE ISOTOPES

11455 (IN2P3–94-02, pp. 63) **Interplay between rotation and vibrations in shape transition and coexistence phenomena.** Girod, M. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Delaroche, J.P.; Berger, J.F.; Libert, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ROTATIONAL STATES/deformed nuclei; VIBRATIONAL STATES/deformed nuclei; DYSPROSIUM 152; GENERATOR-COORDINATE METHOD; HARTREE-FOCK-BOGOLYUBOV THEORY

11456 (IN2P3–94-02, pp. 64) **Studies of octupole deformation in ^{227}Ra; lifetime measurement of the 90-keV 3/2[761] level.** Mach, H. (Uppsala Univ., Nykoeping (Sweden). Studsvik Neutron Research Lab.); Fogelberg, B.; Billowes, J.; Freeman, S.J.; Grant, I.S.; Borge, M.J.G.; Burke, D.G.; Butler, P.A.; Cocks, J.F.C.; Gulda, K. Isolde Collaboration. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/radium 227; RADIUM 227/deformed nuclei; RADIUM 227/octupoles; BETA DECAY; EXCITED STATES; FRANCIUM 227; LIFETIME; OCTUPOLES

11457 (IN2P3–94-02, pp. 66) **DYNASP: A new method to measure electromagnetic moments of unstable nuclei by polarizing after implantation into a semiconductor InP.** Nakamura, S. (Kyoto Univ., Uji (Japan). Inst. for Chemical Research); Ogawa, I.; Takimoto, T.; Matsuki, S.; Okano, K. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ELECTRIC MOMENTS/measuring methods; MAGNETIC MOMENTS/measuring methods; EXCITED STATES; INDIUM PHOSPHIDES; INDIUM 114; ION IMPLANTATION; NUCLEAR STRUCTURE; POLARIZATION

11458 (IN2P3–94-02, pp. 69) **O_2^+ states in ^{76,78}Kr.** Borge, M.G.J. (Istituto Nazionale di Fisica Nucleare, Florence (Italy)); Giannatiempo, A.; Nannini, A.; Perego, A.; Sona, P.; Tengblad, O. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. KRYPTON 76/excited states; KRYPTON 78/excited states; K CONVERSION; LIFETIME; MULTIPOLE TRANSITIONS

11459 (IN2P3–94-02, pp. 70) **Generalized vibrating potential model for collective excitations in deformed nuclei.** Nesterenko, V.O. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/collective excitations; GIANT RESONANCE; POTENTIALS; SELF-CONSISTENT FIELD; VIBRATIONAL STATES

11460 (IN2P3–94-02, pp. 71) **The static quadrupole moment of high-spin isomers in ^{211}Rn and ^{214}Fr measured with Lems.** Neyens, G. (Louvain Univ. (Belgium). Inst. for Nuclear- and Radiationphysics); Nouwen, R.; Van Asbroeck, I.; S'Heeren, G.; Van Den Bergh, M.; Coussement, R. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. FRANCIUM 214/high spin states; FRANCIUM 214/quadrupole moments; RADON 211/high spin states; RADON 211/quadrupole moments; ENERGY-LEVEL TRANSITIONS; ISOMERIC NUCLEI; LEVEL MIXING RESONANCE

11461 (IN2P3–94-02, pp. 72) **Extension of the level mixing resonance method to study β-decaying light exotic nuclei.** Neyens, G. (Louvain Univ. (Belgium). Inst. for Nuclear- and Radiationphysics); Nouwen, R.; Van Asbroeck, I.; Coussement, R. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LEVEL MIXING RESONANCE/beta decay; LEVEL MIXING RESONANCE/quadrupole moments; DEFORMED NUCLEI; ISOMERIC NUCLEI; NUCLEAR FRAGMENTATION

11462 (IN2P3–94-02, pp. 73) **Empirical parameters of the residual p-n interaction in odd-odd deformed nuclei.** Nosek, D. (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Kvasil, J.; Sheline, R.K. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/odd-odd nuclei; DEFORMED NUCLEI/proton-neutron interactions; ROTATION-VIBRATION MODEL; SPECTRAL SHIFT; UNIFIED MODEL

11463 (IN2P3–94-02, pp. 74) **Microscopic description of octupole degrees of freedom in odd-odd deformed nuclei.** Nosek, D. (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Kvasil, J.; Sood, P.C.; Sheline, R.K. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/odd-odd nuclei; E3-TRANSITIONS; OCTUPOLES; PROTON-NEUTRON INTERACTIONS; QUASI PARTICLES; VIBRATIONAL STATES

11464 (IN2P3–94-02, pp. 75) **Isomeric targets and beams.** Oganessian, Yu.Ts. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Karamian, S.A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ISOMERIC NUCLEI/hafnium 178; ISOMERIC NUCLEI/secondary beams; DEFORMED NUCLEI; EXCITED STATES; HIGH SPIN STATES; NUCLEAR STRUCTURE

11465 (IN2P3–94-02, pp. 76) **Rotational motion in spherical shell model configurations.** Caurier, E. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Zuker, A.; Poves, A.; Retamosa, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DEFORMED NUCLEI/rotational states; SHELL MODELS/rotational states; CHROMIUM 48; ZIRCONIUM 80

11466 (IN2P3–94-02, pp. 77) **Prolate collectivity in ^{187}Tl and ^{189}Tl.** Reviol, W. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics); Riedinger, L.L.; Zhang, J.Y.; Bingham, C.R.; Mueller, W.F.; Janssens, R.V.F.; Carpenter, M.P.; Ahmad, I.; Bearden, I.G.; Yu, C.H. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. THALLIUM 187/collective excitations; THALLIUM 189/collective excitations; NUCLEAR STRUCTURE; ROTATIONAL STATES; SUPERDEFORMED NUCLEI

11467 (IN2P3–94-02, pp. 78) **Nuclear halos and their excitation modes.** Riisager, K. (Aarhus Univ. (Denmark). Inst. of Physics). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.*

[137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. EXCITED STATES/nuclear structure; BETA DECAY; E2-TRANSITIONS; NUCLEAR POTENTIAL; STRENGTH FUNCTIONS

11468 (IN2P3–94-02, pp. 79) **Quadrupole-octupole coupled states in ^{144}Nd and the influence of the $\nu(i_{13/2})$ orbital.** Robinson, S.J. (Institut Max von Laue - Paul Langevin (ILL), 38 - Grenoble (France)); Boerner, H.G.; Jolie, J.; Schillebeeckx, P.; Lieb, K.P.; Ulbig, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NEODYMIUM 144/excited states; COUPLING; OCTUPOLES; PHONONS; QUADRUPOLE MOMENTS; VIBRATIONAL STATES

11469 (IN2P3–94-02, pp. 80) **Study of the properties of shape isomers as a function of spin with the Gogny force.** Egido, J.L. (Universidad Autonoma de Madrid (Spain). Dept. de Fisica Teorica); Robledo, L.M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DYSPROSIUM 152/superdeformed nuclei; MERCURY 192/superdeformed nuclei; RUTHENIUM ISOTOPES/superdeformed nuclei; HIGH SPIN STATES; MEAN-FIELD THEORY; NUCLEAR STRUCTURE; RUTHENIUM 88

11470 (IN2P3–94-02, pp. 81) **Quasi-molecular states in ^{48}Cr at high spins.** Royer, G. (Nantes Univ., 44 (France). Lab. de Physique Nucleaire); Mignen, J.; Raffray, Y. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CHROMIUM 48/high spin states; DEFORMED NUCLEI; FISSION; LIQUID DROP MODEL

11471 (IN2P3–94-02, pp. 83) **Search for octupole deformation in neutron rich Xe isotopes.** Bentaleb, M. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Lubkiewicz, E.; Schulz, N.; Durell, J.L.; Liden, F.; Pearson, C.J.; Lister, C.J.; Ahmad, I.; Morss, L.R.; Nash, K.L. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. XENON ISOTOPES/deformed nuclei; XENON ISOTOPES/neutron-rich isotopes; GAMMA SPECTRA; HIGH SPIN STATES; NUCLEAR STRUCTURE; OCTUPOLES; YRAST STATES

11472 (IN2P3–94-02, pp. 86) **Symmetry breaking in the spectra of the odd-A Ac nuclides.** Sheline, R.K. (Florida State Univ., Tallahassee, FL (United States). Dept. of Chemistry); Liang, C.F.; Paris, P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. (CONF-9406212–: Antibes conference on nuclear shapes and nuclear structure at low excitation energies, Antibes (France), 20-25 Jun 1994). In *Nuclear shapes and nuclear structure at low excitation energies. Abstracts of contributed papers.* [137p.] Order Number DE95618649. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ACTINIUM ISOTOPES/symmetry breaking; DEFORMED NUCLEI; ENERGY SPECTRA; OCTUPOLES

11473 (IN2P3–94-02, pp. 88) **Prolate-oblate shape coexistence at Z,N $\approx$ 36,38^{+}.** Skoda, S. (Koeln Univ. (Germany). Inst. fuer Kernphysik); Eberth, J.; Freund, S.; Mylaeus, T.; Wiosna, M. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1994. 11479 (INS–1049) **New algorithm for Hartree-Fock variational equation.** Iwasawa, K.; Sakata, F.; Hashimoto, Y.; Terasaki, J. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Aug 1994. 28p. Order Number DE95747909. Source: OSTI; NTIS; INIS.

Aiming at microscopically understanding the shape-coexistence phenomena, a new algorithm for obtaining many self-consistent Hartree-Fock states is developed. In contrast with the conventional numerical method of solving the constrained Hartree-Fock equation which gives the most energetically favorable state under a given constrained condition, it can find many high-lying Hartree-Fock states as well as many continuous constraint Hartree-Fock solutions by dictating their configurations through some reference state. Numerical calculation is performed by using the Skyrme III. (author).

11480 (IPNO-TH–94-15) **Response function of hot nuclear matter.** Braghin, F.; Vautherin, D. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Feb 1994. 11p. Order Number DE95619307. Source: OSTI; NTIS (US Sales Only); INIS.

The response function of hot nuclear matter to a small isovector external field is investigated. It is shown that for a simplified Skyrme interaction an analytical and self-consistent formula can be derived. An interesting feature of this formula is that it exhibits a privileged value of the interaction strength beyond which a rapid variation of the dipole strength with temperature is obtained. It is concluded that available data for the thermal evolution of giant resonances provide valuable information on the particle-hole effective interaction. (authors). 14 refs., 2 figs.

11481 (IPNO-TH–94-22) **Escape and spreading properties of charge-exchange resonances in ^{208}Bi.** Colo, G. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Van Giai, N.; Bortignon, P.F.; Broglia, R.A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Apr 1994. 31p. Order Number DE95619311. Source: OSTI; NTIS (US Sales Only); INIS.

The properties of charge-exchange excitations of ^{208}Pb with $\Delta L = 0$, i.e., the isobaric analog and Gamow-Teller resonances, are studied within a self-consistent model making use of an effective force of the Skyrme type. The well-known isobaric analog case is used to assess the reliability of the model. The calculated properties of the Gamow-Teller resonance are compared with recent experimental measurements with the aim of better understanding the microscopic structure of this mode. (authors). 30 refs., 5 figs., 6 tabs.

11482 (JAERI-M–94-019, pp. 337-341) **Nuclear level density parameter systematics revisited: nuclear deformation effects.** Mengoni, Alberto (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakajima, Yutaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

All the reaction cross section calculations based on statistical model theory need the evaluation of nuclear level density. This quantity is available by experiment only in the limited range of excitation energy and for the limited set of nuclei in a nuclide chart. Of the models currently employed for the calculation of level density, the Fermi gas model (FGM) is one of the most utilized example. The most important parameter which enters in the evaluation of nuclear level density based on the FGM is the parameter a. This parameter is related to the density of single particle state at the Fermi energy. The purpose of this study is to investigate the effect of nuclear deformation on the systematics of a. The important fact to be considered in the evaluation and calculation of a is that the density of nuclear levels at excitation energy corresponding to the neutron binding energy can be evaluated experimentally by measuring the spacing of neutron resonances. The nuclear structure effects and the nuclear deformation effects on level density parameters are considered to make the parameter a into a slowly varying function of mass number. (K.I.).

11483 (JAERI-M–94-019, pp. 342-345) **Shell-pairing correlations of nuclear level density.** Nakamura, H. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

For the purpose of preparing the systematics of the level density parameters, a revision to the KRK formula has been made. The new formula, similar to the previous one, is based on the analytical expression of the single-particle state density, introducing, in particular, shell-pairing correlation (SPC) terms on it. The systematics of parameters consist of those for the ground states and for the excited states. For the former, the main advantage of present systematics is no direct use of experimental shell and pairing correction energy tables; The mean difference between the empirical and the computed mass excess is $\Delta M = 0.252$MeV for existing 1925 mass data. The results of preliminary analyses for the resonance spacing data are presented. (author).

11484 (JINR–6-63-93, pp. 24-38) **Isotopic lifting of SU(2)-symmetry with applications to nuclear physics.** Santilli, R.M. (Institute for Basic Research, Palm Harbor, FL 34682 (United States)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. In *JINR rapid communications. Collection 6.* 62p. Order Number DE95616386. Source: OSTI; NTIS (US Sales Only); INIS.

We introduce the axiom-preserving, nonlinear, nonlocal and noncanonical their isorepresentations; and prove their lack of unitary equivalence to SU(2). We then apply the theory to the reconstruction of the exact isospin symmetry under electromagnetic and weak interactions and to the exact representation of total magnetic moments for the deuteron and few-body nuclei under the exact isospin symmetry. (author). 20 refs.

High spin states of ^{164}Yb have been populated using the ^{152}Sm (^{16}O, 4n) reaction. The experiment was performed at the NORDBALL array at Risoe, Denmark. A total of 15 decay cascades have been observed. A method has been developed to measure multipolarities and mixing ratios using angular correlations in two-fold γ events. Results are presented for some interband transitions in ^{164}Yb. The method can be applied to any detector array, but has proven particularly useful in the NORDBALL array, which has a favourable detector symmetry. In order to interpret the experimentally observed bands, extensive Cranked Shell Model calculations have been performed for all quasiparticle configurations within an energy limit from the yrast line. The concept of quasiparticles causes spurious states to appear, when calculating large numbers of bands. The reasons behind these non-physical states have been studied and the number of non-physical states compared to the number of physical states has been estimated. 28 refs, 27 figs.

11534 (USIP–94-04) **A calculation of the giant monopole resonance energy in ^{16}O.** Hellmans, R. Stockholm Univ. (Sweden). Dept. of Physics. Nov 1994. 29p. Order Number DE95620544. Source: OSTI; NTIS; INIS.

An important parameter in the nuclear equation of state is the nuclear matter incompressibility. This parameter is related to the giant monopole resonance (GMR) energy. The present work concerns a simple vibrational model for calculating the GMR energy in ^{16}O. For extrapolations to infinite nuclear matter it is necessary to use also heavier nuclei than ^{16}O. The present model could be applicable to such systems as well. The basic idea of this model is to describe the wave function barΨ> of the nucleus as a superposition of states:barΨ>=Σc_ibar$\Phi^{\nu}i$>, where bar$\Phi^{\nu}i$> is a nuclear wave function with a specific value v_i of some collective vibrational parameter. As a generator for the non-ortogonal basis (bar$\Phi^{\nu}i$>), a single particle shell model is used and the single particle potential gives candidates for the collective vibrational parameter. Evaluation of the state barΨ> is accomplished by solving the (discrete) Hill-Wheeler equation, with Skyrme type interactions. There are as many solutions, i.e. different states barΨ>, to the Hill-Wheeler equation as there are states in the basis (bar$\Phi^{\nu}i$>). The energy spectrum for these solutions is in its lower part approximately harmonic and the energy difference between states in this part of the spectrum gives the GMR energy E_{GMR}. As can be seen the three main ingredients are: shell model generator, Skyrme type interaction and the Hill-Wheeler equation. They will be discussed in detail in the next section. The main subject of this work is to investigate monopole resonance (MR) generated through bulk density vibrations, but some indications of using this model for studying the importance of surfacedensity vibrations as well as coupled bulk and surface density vibrations will be given. The results obtained with this model appear to be comparable with the results Gleissl et al obtain in their density variational approach.

We have studied the β-decay of ^{37}Ca at the projectile fragment separator FRS and GSI Darmstadt. The resulting Gamow-Teller strength function B(GT) which is important for determining the detection efficiency of the Homestake mine ^{37}Cl detector is significantly changed by the inclusion of previously unobserved β-delayed γ-rays. With the new results former discrepancies between the B(GT) values measured in the ^{37}Ga β-decay and those extracted from ^{37}Cl(p, n)^{37}Ar reactions are drastically reduced. Additionally, our data yield evidence for an isospin-forbidden Fermi transition in the β-decay of ^{37}Ca. (orig.)

Charged-particle emission from nuclear groundstates or isomeric states is reviewed with particular emphasis on recent results. The proton-radioactive states, identified near ^{100}Sn and ^{146}Gd, yield

tentative evidence for a relation between spectroscopic factor and nuclear shape. Examples for recent alpha-decay work include a discussion of $0^+ \rightarrow 0^+$ groundstate-to-groundstate transitions and of $0^+ \rightarrow 0_1^+$ fine-structure transitions in the lead region. For very proton-rich isotopes above ^{100}Sn, both proton, alpha and cluster emission has been found, ^{114}Ba representing the lightest cluster-radioactive nucleus identified so far. This region of the chart of nuclides may thus be suitable for testing theoretical models for charged-particle decay. (orig.)

11537 (GSI–94-82(prepr.)) **Production and decay of ^{269}110.** Hofmann, S. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Ninov, V.; Hessberger, F.P.; Armbruster, P.; Folger, H.; Muenzenberg, G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 5p. Order Number DE95752102. Source: OSTI; NTIS (US Sales Only); INIS.

In an experiment carried out to identify element 110, we have observed an α-decay chain, that can be unambiguously assigned to ^{269}110. In a series of preexperiments the excitation functions of the fusion reactions $^{50}Ti+^{208}Pb \rightarrow ^{258}104^*$ and $^{58}Fe+^{208}Pb \rightarrow ^{266}108^*$ were measured with high precision in order to get the optimum projectile energies for the production of these heavy elements. The cross-section maxima of the 1n evaporation channels were observed at excitation energies of 15.6 MeV and 13.4 MeV, respectively. These data result in an optimum excitation energy of 12.3 MeV of the compound nucleus for the production of ^{269}110 in the reaction $^{62}Ni+^{208}Pb \rightarrow ^{269}110+1n$. In irradiations at the corresponding beam energy of 311 MeV we have observed a decay chain of 4 subsequent α decays. This can be assigned to the isotope with the mass number 269 of the element 110 on the basis of delayed α-α coincidences. The accurately measured decay data of the daughter isotopes of the elements 108 to 102, obtained in the previous experiments, were used. The isotope ^{269}110 decays with a half-life of $(270_{-120}^{+}\{1300\})$ μs by emission of (11.32±0.020) MeV alpha particles. The production cross-section is $(3.3_{-02.7}^{+}(6.2))$ pb. (orig.)

11538 (GSI–94-83(prepr.)) **β-decay of ^{37}Ca.** Trinder, W. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Adelberger, E.G.; Janas, Z.; Keller, H.; Krumbholz, K.; Kunze, V. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 10p. Order Number DE95745763. Source: OSTI; NTIS (US Sales Only); INIS.

The β-decay of ^{37}Ca has been studied. The half-life was remeasured with improved precision to be 181(1) ms, and β-delayed γ-rays were observed for the first time. The surprisingly high Γ_γ/Γ_p values for proton-unbound states in ^{37}K drastically reduce former discrepancies between the Gamow-Teller strength values B(GT) measured in the ^{37}Ga β-decay and those deduced from the ^{37}Cl(p, n)^{37}Ar mirror reaction. (orig.)

11539 (GSI–94-84(prepr.)) **Gamow-Teller strength in the β-decay of ^{36}Ca.** Trinder, W. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Adelberger, E.G.; Brown, B.A.; Janas, Z.; Keller, H.; Krumbholz, K. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 12p. Order Number DE95752103. Source: OSTI; NTIS (US Sales Only); INIS.

The β-decay of ^{36}Ca has been studied at the projectile fragment separator at GSI Darmstadt. The Gamow-Teller strength function B(GT), deduced from the observed β-delayed proton- and γ-emission and from the measured half-life of 102(2) ms, is compared to results obtained from large-scale sd-shell model calculations. (orig.)

11540 (GSI–95-05(prepr.)) **The new element 111.** Hofmann, S. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Ninov, V.; Hessberger, F.P.; Armbruster, P.; Folger, H.; Muenzenberg, G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 3p. Order Number DE95755953. Source: OSTI; NTIS (US Sales Only); INIS.

The new element 111 was produced and unambiguously identified in an experiment at SHIP, GSI Darmstadt. Three nuclei of the isotope ^{272}111 were observed in irradiations of ^{209}Bi targets with ^{64}Ni projectiles of 318 MeV and 320 MeV energy. The cross-sections are $(1.7^{+3.3}_{-1.4})$ pb and $(3.5^{+4.6}_{-2.3})$ pb, respectively. The nuclei decay by α emission into the new and so far the heaviest isotopes of the elements 109 and 107 with mass numbers A=268 and A=264. The α-decay chains were followed down to the known nuclei ^{260}105 and ^{256}Lr. (orig.)

11570 (INDC(SWD)–024) **Absolute gamma branching ratios for fission products in the mass range 74-165.** Rudstam, G. (Uppsala Univ., Nykoeping (Sweden). Studsvik Neutron Research Lab.). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Nov 1993. 63p. Order Number DE95619315. Source: OSTI; NTIS (US Sales Only); INIS.

A literature search has been carried out with the goal to list experimental determinations of absolute branching ratios of gamma-rays emitted from fission products. The branching ratios are required in all cases when the number of atoms of a given nuclide in a sample is to be determined by gamma spectroscopy. The mass range covered in the study is 74-165. The upper limit of the half-life of the nuclides considered has been chosen to be a few years. Thus very long-lived species are not included. (author). 6 refs, 92 tabs.

11571 (JAERI-M–94-019, pp. 264-270) **Measurement of beta-decay half-lives of short-lived nuclei.** Itoh, S. (Nagoya Univ. (Japan). School of Engineering); Tanaka, A.; Yamamoto, H.; Kawade, K.; Iida, T.; Takahashi, A. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The half-lives of short-lived nuclei produced by 14MeV or thermal neutron bombardments were measured with Ge detectors in the multi-scaling mode. The corrections for pile-up and dead-time losses were performed by applying source and pulser methods. The half-lives of ^{29}Al, ^{79m}Se, ^{86m}Rb, ^{107m}Pd, ^{107m}Ag and ^{122m}Sb were determined with accuracies of 0.3-0.7%. (author).

11572 (JAERI-M–94-019, pp. 346-350) **Comments on ENSDF. From the evaluator to dear bitter users.** Kitao, Kensuke (Japanese Nuclear Data Committee, Tokai, Ibaraki (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Evaluated Nuclear Structure Data File (ENSDF) is a data base derived from only published experimental research papers. Some incomplete parts still exist in the file as pointed out by users, but it is unavoidable according to present policies for preparation of the file. About 96% of decay data sets in ENSDF have the normalization factor (that to give the intensity per 100 disintegration of parent nucleus). For lack of experimental data, the accuracy of these factors is still a problem. In ENSDF, about nine-hundred radionuclides of decay data sets contain unplaced gamma-rays. The number of such gamma-rays is amount of about 16800, and the one-hundred twelve isomers have not established excited energy. (author).

11573 (JINR-E–3-93-61, pp. 53-56) **Cluster emission of ^{114}Ba.** Tretyakova, S.P. (and others). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 205p. (CONF-9203318–: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. International Workshop Solid State Nuclear Track Detectors and their Applications.* Order Number DE95620429. Source: OSTI; NTIS (US Sales Only); INIS.

The reaction ^{58}Ni(^{58}Ni,2n)^{114}Ba was chosen for this purpose. The cross section calculations of this reaction give the value of $\simeq 10^{-30}$cm^2. The first experimental data observation by dielectric detector on searching for cluster radioactive decay of ^{114}Ba are presented.

DOE Contract AC03-76SF00098. (CONF-940888–Vol.2: Physics with large gamma ray detector arrays conference, Berkley, CA (United States), 2-6 Aug 1994). Order Number DE95006900. Source: OSTI; NTIS; INIS; GPO Dep.

The conference on "Physics from Large γ-ray Detector Arrays" is a continuation of the series of conferences that have been organized every two years by the North American Heavy-ion Laboratories. The aim of the conference this year was to encourage discussion of the physics that can be studied with such large arrays. This volume is the collected proceedings from this conference. It discusses properties of nuclear states which can be created in heavy-ion reactions, and which can be observed via such detector systems.

To appear in Physical Review, B: Solid State (US).

The density of states for a finite or an infinite cluster of scatterers in the case of both, electrons and photons, can be represented in a general form as the sum over all Krein-Friedel contributions of individual scatterers and a contribution due to the presence of multiple scatterers. The latter is given by the sum over all periodic orbits between different scatterers. General three dimensional multiple-scattering theory for electromagnetic waves in the presence of scatterers of arbitrary shape is presented. Vector structure constants are calculated and general rules for obtaining them from known scalar structure constants are given. The KKR equations for photons are explicitly written down. (author). 22 refs., 2 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

Mechanisms of energy transfer from high energy hadronic and nuclear projectiles to nuclear targets were investigated experimentally. The transfer is realized in two cardinal processes: in passage of the hadron through layers of intranuclear matter accompanied by emission of nucleons with energies from about 20 to about 400 MeV; in the particle production process, this process goes through intermediate objects. 19 refs., 1 tab.

11598 (JINR-E–1-94-322) **Atomic Nuclei Utter Disintegration into Nucleons by High Energy Nuclear Projectiles.** Strugalski, Z. (Politechnika Warszawska, Warsaw (Poland). Inst. Fizyki). Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 10p. Order Number DE95623751. Source: OSTI; NTIS (US Sales Only); INIS.

The disintegration process of atomic nuclei by high energy nuclear projectiles is described. The physical basis for this process is the passage of hadrons through layers of intranuclear matter accompanied by the nucleon emission from the target nuclei observed in experiments; kinetic energies of the nucleons are from about 20 up to about 400 MeV - in the target nucleus reference system. 22 refs., 3 tabs.

A short version of the invited lectures given at the International Study Centre on Nonlinear Science 'Dynamics of Transport in Fluid, Plasmas and Charged Beams', Villa Gualino, Torino, Italy, Jun-Sep 1994.

The relativistic kinetic equations describing nuclear reactions at intermediate energies are obtained on the dynamical basis. These equations are analyzed and realized in several versions of the Cascade Exciton Model (CEM). The CEM assumes that reactions occur in three stages: the intranuclear cascade, pre-equilibrium and the evaporative ones. A large variety of experimental data on hadron- and photonuclear reactions in the bombarding energy range up to several GeV are analyzed in this approach. The contributions of different pion and photon absorption mechanisms and the relative role of different particle and photon production mechanisms in these reactions are estimated. The CEM describes adequately nuclear reactions at intermediate energies and has one of the best predictive powers as compared to other available modern models. 55 refs., 10 figs., 1 tab.

11603 (UM-P–93/101) **Inversion of electron-water elastic scattering data.** Lun, A.; Chen, X.J.; Allen, L.J.; Amos, K. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 33p. Order Number DE95619323. Source: OSTI; NTIS (US Sales Only); INIS.

Fixed energy inverse scattering theory has been used to analyse the differential cross-sections for the elastic scattering of electrons from water molecules. Both semiclassical (WKB) and fully quantal inversion methods have been used with data taken in the energy range 100 to 1000 eV. Constrained to be real, the local inversion potentials are found to be energy dependent; a dependence that can be interpreted as the local equivalence of true nonlocality in the actual interaction. 14 refs., 4 tabs., 8 figs.

11604 (UM-P–94/35) **Two body potentials from quantal inversion differential cross section data.** Amos, K.; Allen, L.J.; Lun, D.R.; Steward, C. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 4p. Order Number DE95619324. Source: OSTI; NTIS (US Sales Only); INIS.

Quantal inverse scattering theory has been applied to the analysis of elastic scattering differential cross-section data from nuclear heavy ion, nucleon-nucleus, electron-atom, atom-atom and electron-molecule collisions. For all such systems, application has led to central local potentials whose use in finding solutions of the radial Schroedinger equations give excellent fits to the measured data. 5 refs., 1 fig.

The concept and experimental programme of the secondary nuclear beam facility BRENDA at GSI is presented. The central part of BRENDA is the magnetic spectrometer FRS providing spatially separated monoisotopic exotic beams of all elements up to uranium. The FRS as a versatile magnetic spectrometer for experiments with heavy ions in the energy range of (0.1-2) A.GeV has been used to study peripheral nuclear collisions from oxygen up to uranium projectiles. In the uranium experiments we discovered that projectile fission is a powerful tool to investigate new neutron-rich fission fragments. In the medium mass region we have identified the doubly magic nucleus ^{100}Sn and measured its half-life. Light halo nuclei have been studied in kinematically complete experiments with the FRS in combination with the dipole magnet ALADIN, and the neutron detector LAND. The FRS combined with the storage and cooler ring ESR offers new precision experiments, e.g., direct mass measurements, decay studies of highly-charged nuclei, or nuclear structure studies in inverse kinematics. The potential of using binary reactions in targets containing Be is discussed. Data are presented from the use of Be and BeF_2 targets bombarded with 1.5, 1.7, 1.8 and 1.9 MeV protons. Neutron production is enhanced by the presence of the F by factors of $\approx$4.

11607 (FZR–56(prepr.)) **Interplay of collective flow phenomena and velocity correlations of intermediate-mass fragments in collisions of Au + Au at E = 100 - 400A.MeV.** Kotte, R. (Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany)); Moesner, J.; Kaempfer, B. FOPI Collaboration. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). Sep 1994. 29p. Order Number DE95752184. Source: OSTI; NTIS (US Sales Only); INIS.

Velocity correlations of intermediate mass fragments (IMFs), produced in collisions of Au+Au at 100, 150, 250, and 400 A.MeV beam energy, are extracted from measurements with the FOPI (phase I) detector system at SIS in GSI Darmstadt. The IMF correlation functions of peripheral and semi-central events are found to be strongly affected by the collective sideward motion of nuclear matter. The sideflow causes an enhancement of correlations at small relative velocities. This enhancement results from the mixing of differently azimuthally oriented events; it vanishes if the events are rotated into a unique reaction plane. Selecting violent central collisions, the comparison of the data with a Coulomb dominated final-state interaction model points to a radius of the expanding and multifragmenting source of $R_s \simeq 13$ fm for 100 A.MeV which appears shrinking by 20% when increasing the projectile neergy to 400 MeV per nucleon. The deduced source radii are found to depend on the radial explosion energy used in the model. The inclusion of such collective expansion is necessary for a reasonable description of the experimental single-particle spectra of the IMFs. The unique Coulomb suppression of small relative IMF velocities, found for the

given beam energy range, is attributed to rather constant averaged next-neighbour distances left angle d_{IMF} right angle $=8.6\pm0.2$ fm of the IMF charge centers within the source at break-up time. (orig.)

11608 (FZR–93-14(prepr.)) **Velocity correlations of intermediate mass fragments produced in central collisions of Au + Au at E = 150 A.MeV.** Kaempfer, B. (Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany)); Kotte, R.; Moesner, J.; Neubert, W.; Wohlfarth, D. FOPI Collaboration. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). May 1993. 13p. Order Number DE95746706. Source: OSTI; NTIS (US Sales Only); INIS.

Velocity correlations of intermediate mass fragments (IMFs), produced in central collisions of Au + Au at 150 A.MeV beam energy, are extracted from measurements with the FOPI (phase I) detector system at SIS in GSI Darmstadt. The IMF correlation function for semicentral events is found to be affected by the directed sideward flow. When rotating the events into a unique reaction plane an enhancement of correlations, resulting from event mixing effects, vanishes. Selecting violent collisions with a high degree of azimuthal symmetry the correlation function appears nearly independent of additional event or single particle gate conditions. The comparison of the data with a Coulomb dominated final-state interaction model points to time scales of $\tau \propto 25$ fm/c or less for emitting IMFs from an expanding and multifragmenting source with radius $R \propto 14$ fm. (orig.)

11609 (GSI–94-61(prepr.)) **Bose-Einstein correlations of unstable particles.** Henning, P.A. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Forschungsbereich Theorie); Hoelbling, C. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Sep 1994. 9p. Order Number DE95746188. Source: OSTI; NTIS (US Sales Only); INIS.

Within a field theoretical formalism suited to treat inhomogeneous hot quantum systems, we derive the two-particle correlation function for particles having a spectral width γ in the region of their emission. We find, that this correlation function measures the radius R_0 of the thermal source only in case $\gamma R_0 > 1$. (orig.)

11610 (GSI–94-72(prepr.)) **Pion production in nucleus-nucleus collisions at intermediate energies.** Senger, P. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 14p. (CONF-9409242–: CORINNE 2: international conference on multiparticles correlation and particle production in nucleus-nucleus collisions, Nantes (France), 5-9 Sep 1994). Order Number DE95752248. Source: OSTI; NTIS (US Sales Only); INIS.

Some of the important features of pion production in nucleus-nucleus collisions at intermediate energies are discussed in the following. The paper presents a selection of pion data measured in the last two decades and contains results from the pioneering experiments at LBL up to the recent measurements at GSI. (orig.)

11611 (GSI–94-74(prepr.)) **Multidimensional analysis of collective sidewards flow in Au on Au reactions between 100 and 1050 A MeV.** Wienold, T. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Fan, Z.G.; Hartnack, C. FOPI Collaboration. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 15p. Order Number DE95756121. Source: OSTI; NTIS (US Sales Only); INIS.

An excitation function of the Au on Au reaction from 100 to 1050 A MeV was measured using the FOPI-facility at GSI Darmstadt. Nuclear charge ($Z \leq 15$) and velocity of the product were detected with full azimuthal acceptance at laboratory angles $1 \leq \Theta_{lab} \leq 30$. For the first time an analysis is presented which combines the azimuthally asymmetric part of the transverse flow (sidewards flow), stopping and the associated collision geometry. In comparison to microscopic transport model calculations we demonstrate the relevance of this method for the extraction of the nuclear equation of state. (orig.)

11612 (GSI–94-77(prepr.)) **Spontaneous-fission half-lives of deformed superheavy nuclei.** Smolanczuk, R. (Soltan Inst. for Nuclear Studies, Warsaw (Poland)); Skalski, J.; Sobiczewski, A. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 20p. Order Number DE95752098. Source: OSTI; NTIS (US Sales Only); INIS.

Spontaneous-fission half-lives of heaviest nuclei are analyzed in a multidimensional deformation space. They are calculated in a dynamical approach, without any adjustable parameters. The potential energy is obtained by the macroscopic-microscopic method and the inertia tensor by the cranking method. The action integral is minimized by a variational procedure. Even-even nuclei with proton number Z=104-114 and neutron number N=142-176 are considered. The results reproduce rather well the existing experimental data for the considered nuclei and predict relatively long half-lives for many nuclei not yet observed, sufficient to detect them if synthesized in a laboratory. (orig.)

11613 (GSI–94-89(prepr.)) **Coherent Bremsstrahlung emission in the early stage of relativistic heavy ion collisions.** Bertulani, C.; Mornas, L.; Ornik, U. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 7p. (CONF-941261–: 5. workshop on hadronic interactions, Sao Paulo (Brazil), 1-3 Dec 1994). Order Number DE95755770. Source: OSTI; NTIS (US Sales Only); INIS.

We present a model of coherent Bremsstrahlung emission from the compression phase of relativistic heavy ion collisions based on a hydrodynamical description of the collision process. The deceleration of the matter through a shock front, calculated in 1-D relativistic dissipative hydrodynamics, is at the origin of a copious Bremsstrahlung emission. The interferences between the Bremsstrahlung emitted by two receeding shock fronts result in deviations from the usual $1/\omega$ law, with in particular a strong suppression of low energy photons in symmetric collisions. We show how it might be possible to obtain information on the equation of state, possible transition to a quark gluon plasma and dynamical properties of the matter from the study of the interference pattern. We show that the optimal region for the observation of coherent photons is in SIS-AGS energy range. (orig.)

11614 (GSI–94-91(prepr.)) **Thermal photon production in heavy ion collisions.** Arbex, N. (Marburg Univ. (Germany). Fachbereich 13 - Physik); Ornik, U.; Pluemer, M.; Timmermann, A.; Weiner, R.M. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 14p. Order Number DE95755768. Source: OSTI; NTIS (US Sales Only); INIS.

Using a three-dimensional hydrodynamic simulation of the collision and an equation of state containing a first order phase transition to the quark-gluon plasma, we study thermal photon production for Au+Au collisions at $E_{lab}=11.5$ AGeV and for Pb+Pb collisions at 160 AGeV. We obtain surprisingly high rates of thermal photons even at the lower energy, suggesting that, contrary to what was expected so far, photon production may be an interesting topic for experimental search also at the Alternating Gradient Synchrotron. When applied to the reaction S+Au at 200 AGEV, our model can reproduce preliminary data obtained by the WA80 Collaboration without having to postulate the existence of an extremely long-lived mixed phase as was recently proposed. (orig.)

11615 (GSI–94-92(prepr.)) **On the role of dissipation in the early stage of relativistic heavy ion collisions.** Mornas, L.; Ornik, U. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 31p. Order Number DE95755767. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of the dissipative terms on the conditions of formation and the characteristic parameters of shock waves in relativistic nuclear collisions is investigated for three types of equation of state (non linear QHD-1, resonance gas and lattice QCD). Energy and velocity profiles are obtained in a one-dimensional model; the duration of the shock phase and width of the shock front are calculated. It is shown that the presence of a phase transition results in a strong enhancement of the width of the shock front, which results in an increase of transparency. This effect, combined with the fact that the nuclei have a finite size, prevents the energy density to rise to its maximum value (full stopping) as would be predicted by a non dissipative shock model. (orig.)

11616 (GSI–95-01(prepr.)) **Longitudinal and transverse momentum distributions of ^{9}Li fragments from break-up of ^{11}Li.**

Humbert, F. (Technische Hochschule Darmstadt (Germany). Inst. fuer Kernphysik); Nilsson, T.; Schwab, W. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 14p. Order Number DE95755989. Source: OSTI; NTIS (US Sales Only); INIS.

Transverse and longitudinal momentum distributions of ^{9}Li fragments from ^{11}Li break-up reactions in C, Al and Pb targets have been measured at 280 MeV/u. The two-neutron removal cross-section was measured to be σ_{-2n}=0.26±0.02 b for the carbon target, σ_{-2n}=0.47±0.08 b for the aluminum target and σ_{-2n}=1.9±0.4 b for the lead target. No significant difference is observed between the narrow widths (FWHM≈47 MeV/c) of the transverse and longitudinal momentum distributions of the ^{9}Li fragments. The physical implications of this are discussed. (orig.)

11617 (GSI–95-03(prepr.)) **Study of the unstable nucleus ^{10}Li in stripping reactions of the radioactive projectiles ^{11}Be and ^{11}Li.** Zinser, M. (Gesellschaft fuer Schwerionenforschung, Darmstadt (Germany)); Humbert, F.; Nilsson, T. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 11p. Order Number DE95755952. Source: OSTI; NTIS (US Sales Only); INIS.

Reactions of the halo systems ^{11}Be and ^{11}Li (at 460 and 280 MeV/u) with a carbon target demonstrate that the transverse momentum distribution of neutrons observed in coincidence with selected fragments is sensitive to details of low-energy nuclear structure. It is shown that (n+^{9}Li) has an (unbound) l=0 ground state with a scattering length of the order of -20 fm or less. The neutron halo of ^{11}Li has appreciable $(1s_{1/2})$ and $(0p_{1/1})^2$ components. (orig.)

11622 (INDC(PAK)–008) **The global optical potentials and neutron - Nucleus scattering data.** Qureshi, I.E. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Radiation Physics Div.); Khan, Q.H. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Nov 1993. 13p. Order Number DE95619332. Source: OSTI; NTIS (US Sales Only); INIS.

We have compared the predictions of three global optical potentials with the (21.6 MeV) neutron-nucleus elastic scattering data. Nine nuclides within the mass range $40 \leq A \leq 209$ were chosen for this comparative study. By fitting the differential cross-section data with Legendre polynomials, it was possible to plot the ratio of theoretical and experimental cross sections as a function of scattering angle. Significant deviations of this ratio occur at the positions of diffraction maxima and minima. The integrated quantities i.e. total elastic cross sections, volume integrals and mean-square-radii for the three potentials under consideration have also been calculated and compared with the corresponding values obtained by using individual best fit potentials. (author). 18 refs, 3 figs, 3 tabs.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

In recent publications it was demonstrated that many nuclear properties are correlated to the values of 2Z-N of the nuclei. In this respect Z is the atomic number and N is the number of neutrons. One of the nuclear properties that was found to be strongly correlated to the 2Z-N values of different fissile isotopes was the number of the delayed neutrons after fission. The results in this respect indicates that there is a correlation with regards to the yields of the delayed neutrons precursors. This fact led us to investigate whether there are correlations with other fission products yields. In order to obtain a large data base of fission products yields we have considered fast fissions. Another advantage of fast fissions is that the fission products yields is less sensitive to the energy of the neutrons causing the fission. In our analysis we have considered seven fast fissile isotopes. The isotopes considered were thorium 232 uranium 238 uranium 235, uranium 233 plutonium 241 plutonium 240 and plutonium 239. The fission products yields were taken from a compilation used in the KORIGEN code, which is based on JEF-1 library. In our analysis we have considered 576 fission products isotopes and isomers. We have found that in most of the cases the fission products' yields are correlated to the 2Z-N values of the fissile isotopes (the compound nuclei). Namely, isotopes with the same 2Z-N values have about the same fission products yields. (author). 6 refs., 2 figs.

11624 (INS–1058) **Ξ^--hypernuclear states in heavy nuclei.** Tadokoro, S.; Kobayashi, H.; Akaishi, Y. Tokyo Univ., Tanashi

(Japan). Inst. for Nuclear Study. Sep 1994. 23p. Order Number DE95747908. Source: OSTI; NTIS; INIS.

The possibility of observing heavy Ξ-hypernuclei by (K^-,K^+) reactions is investigated. Several narrow peaks are clearly seen in the K^+ spectrum of $^{208}Pb(K^-,K^+)_{\Xi^-}{}^{208}Hg$ reaction calculated by the Green's function method. They correspond to Ξ^- bound states with spin-stretched high angular momentum. The excitation of the Ξ^- bound states amounts to about 0.5 μb/sr/MeV for the ^{208}Pb target in the case of 2 MeV detector resolution, which is considerably larger than that for the ^{12}C target. It is discussed whether the mass-number dependence of nucleus-Ξ potential depths is observed between A=12 and 208 or not. (author).

11625 (JAERI-M–94-019, pp. 7-19) **Nuclear data activities in the United States.** Mann, F.M. (Westinghouse Hanford Co., Richland, WA (United States)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The recent activities in USA in the measurement, evaluation and testing of nuclear data are presented. The information presented is based on the recent meeting of the Cross Section Evaluation Working Group held from October 5 to 7, 1993 and on the input from important committee chairmen. The ENDF/B-VI evaluations released during the summer included the neutron-induced reaction evaluations for the nuclides of 18 elements, the neutron-induced fission product yields for 31 nuclides, the spontaneous fission product yields for 9 nuclides, and the high energy reaction evaluations for ^{12}C, ^{56}Fe, ^{208}Pb and ^{209}Bi. The reports on 5 meetings were given. The neutron-induced reaction evaluations for 15 materials are tentatively expected from 5 laboratories. "The ENDF/B-VI Neutron Cross Section Measurement Standards" has been published. Thermal benchmarking continues, and the results have been available from 5 laboratories. The need to more closely interact with the ultimate customers of nuclear data was recognized, and there also may be the need to reorganize the working group. The activities of Los Alamos and Oak Ridge National Laboratories are reported. Three appendices are attached. (K.I.).

11626 (JAERI-M–94-019, pp. 113-122) **Theoretical approach to proton upset.** Shimano, Yosuke (National Space Development Agency of Japan, Tokyo (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

A three-part simulation program for calculating the cross section of proton upset was developed. The first part, NUREAC, is for the calculation of the cross section of proton-silicon inelastic diffusion. The second, ELASTIC, is for that of elastic diffusion. The last one, SEU, calculates the global proton-upset cross section, using the results of NUREAC and ELASTIC. The calculated values of this program for DRAM (Dynamic Random Access Memory) devices were compared with the real experimental values. (author).

Neutron capture reactions are considered to play important roles in the primordial nucleosynthesis and stellar nucleosynthesis. In this paper we discuss the experimental study of the neutron capture reaction of light nuclei in connection with the nucleosynthesis of intermediate-mass nuclei in inhomogeneous big-bang models and during stellar evolution. In the experiment we used pulsed neutrons and detected prompt γ-rays from radiative neutron capture into the low-lying states of residual nuclei. (author).

11628 (JAERI-M–94-019, pp. 191-199) **Measurements of double-differential α-particle production cross sections using a gridded ionization chamber. Application of $^{14}N(d,n)^{15}O$ and $^{15}N(d,n)^{16}O$ neutron sources.** Matsuyama, Isamu (Tohoku Univ., Sendai (Japan). Faculty of Engineering); Baba, Mamoru; Matsuyama, Shigeo. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Double-differential α-particle production cross sections of natural Ni,Fe,Cu and enriched ^{50}Cr were measured using a specially designed gridded ionization chamber for 7.6 and 11.5 MeV neutrons produced by the $^{14}N(d,n)^{15}O$ (Q=5.12 MeV) and $^{15}N(d,n)^{16}O$ (Q=9.88 MeV) reactions. The $^{14}N(d,n)^{15}O$ and $^{15}N(d,n)^{16}O$ reactions proved to be useful to obtain 7 to 13 MeV neutrons for α-production studies with a 4.5 MV Dynamitron accelerator at Tohoku University. (author).

11629 (JAERI-M–94-019, pp. 210-219) **Application of large volume liquid scintillator for scattering cross section measurements.** Matsuyama, Shigeo (Tohoku Univ., Sendai (Japan). Faculty of Engineering); Ohkubo, Takeshi; Baba, Mamoru; Iwasaki, Shin; Soda, Daisuke; Hirakawa, Naohiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

We have developed a large volume NE213 liquid scintillator (LLS)/1/and applied for scattering cross section measurements using time-of-flight (TOF) method. The scintillator cell of the LLS is a long rectangular glass tube, 80 cm long, 10 cm width and 6.5 cm thick, and is viewed by two fast photomultipliers from both end of the cell. Position information can be obtained from the time differences between two photomultipliers with resolution better than 7 cm. Time compensated signals needed for TOF experiments are provided by a mean timer. Data are acquired for main TOF, position TOF and pulse height signals, which are gated by n-γ discriminator signals, by a 3-parameter data acquisition system to get uniform bias levels independently of the event position. A data acquisition and processing method is developed for effective use of the LLS. The detector efficiency is three times larger and the timing properties is better than that of the 14 cmϕ x 10 cm thick NE213 detector used in our scattering cross section measurements. The performance of the LLS as a position sensitive detector was examined by measuring the secondary neutron TOF spectra at 14.1 MeV. The LLS was also applied successfully to scattering cross section measurements as a single large TOF detector for 11.5 MeV neutrons by low intensity $^{15}N(d,n)^{16}O$ neutron source. (author).

11630 (JAERI-M–94-019, pp. 220-229) **Measurements of double differential α-particle emission cross sections of ^{12}C with 14 MeV incident neutrons.** Nishizawa, Hiroshi (Osaka Univ., Suita (Japan). Faculty of Engineering); Takahashi, Akito; Murakami, Yoshinobu. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Double differential α-particle emission cross sections of ^{12}C with 14.1MeV incident neutrons were measured at 5 angle points between 30 and 90 degrees based on the E-TOF two dimensional analysis. Experimental method and measured data compared with Haight's data are shown. In this experiment the angular dependence of a component of the $^{12}C(n,\alpha)^{9}Be_{g.s.}$ reaction was observed; while for the continuum component of the $^{12}C(n,n')3\alpha$ reaction, angular-dependence was not clearly observed. (author).

11631 (JAERI-M–94-019, pp. 230-242) **Measurements of the neutron scattering cross sections for ^{12}C, ^{16}O, ^{40}Ca and ^{56}Fe at 14.2 MeV.** Nishio, Teiji (Rikkyo Univ., Tokyo (Japan). Dept. of Physics); Shirato, Shoji; Ando, Yoshiaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993;

INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Double different cross sections and energy-integrated differential ones for elastic and inelastic scattering from ^{12}C, ^{16}O, ^{40}Ca, and ^{56}Fe at 14.2 MeV have been measured at forward angles from 10° to 70° in 10° steps. The experimental data have been compared with the predictions of JENDL-3 as well as those of optical model and DWBA calculations. (author).

11632 (JAERI-M–94-019, pp. 253-263) **Measurement of formation cross sections producing short-lived nuclei. Mg, S, Ga, Y, Mo, Pd, Sn.** Yamauchi, K. (Nagoya Univ. (Japan). School of Engineering); Kasugai, Y.; Yamamoto, H.; Kawade, K.; Takahashi, A.; Iida, T. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Neutron activation cross sections of short-lived nuclei with half-lives between 40 s and 18 min. have been systematically measured at neutron energy of 13.4 to 14.9 MeV by activation method. Cross sections for $^{26}Mg(n,np)^{25}Na$, $^{32}S(n,t)^{30}P$, $^{71}Ga(n,\alpha)^{68m}Cu$, $^{98}Mo(n,np)^{97m}Nb$, $^{100}Mo(n,np)^{99m}Nb$, $^{106}Pd(n,np)^{105m}Rh$ and $^{119}Sn(n,p)^{119m}In$ were measured. (author).

11633 (JAERI-M–94-019, pp. 271-275) **Measurement of hyperfine structure in ^{143}Pr ($T_{1/2}$ = 13.6d) by collinear laser-ion-beam spectroscopy.** Iimura, Hideki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakahara, Yoshinori; Ichikawa, Shin-ichi; Kubota, Masashi; Horiguchi, Takayoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The hyperfine structure in the radioactive isotope ^{143}Pr have been measured by collinear laser-ion-beam spectroscopy. The purpose of this work and the experimental details are given. (author).

11634 (JAERI-M–94-019, pp. 290-299) **Evaluation of ^{238}U inelastic scattering cross section.** Kawano, Toshihiko (Kyushu Univ., Fukuoka (Japan)); Fujikawa, Noboru; Kanda, Yukinori. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

A new evaluation of ^{238}U inelastic scattering cross sections has been made. A coupled-channels model is adopted for calculation of direct inelastic scattering cross sections to the excited levels which belong to the vibrational bands of ^{238}U, as well as the ground state rotational band. The members of a certain vibrational band are coupled to the 0^+-2^+-4^+ triad of the ground state rotational band levels. A band coupling strength β is determined from the experimental inelastic scattering data below 3 MeV. Experimental double differential cross sections (DDX) are also taken into account in the β determination. The calculated level excitation cross sections and the calculated DDX reproduce consistently the experimental data. (author).

11635 (JAERI-M–94-019, pp. 300-309) **Evaluation of neutron cross sections of ^{12}C up to 50 MeV.** Chiba, Satoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Fukahori, Tokio; Watanabe, Yukinobu; Koyama, Yoshihide. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The neutron cross sections of ^{12}C have been evaluated in the energy range of 20 to 50 MeV. The total cross section was determined by the generalized least-squares method taking account of the available experimental information. Other quantities are evaluated with the aid of theoretical calculations. The spherical optical model was employed to evaluate the reaction and elastic scattering cross sections. The inelastic scattering to the first excited 2^+ state was calculated based on the DWBA. The optical potentials used in these calculations were obtained in a microscopic way. The double-differential data for neutron, proton, deuteron, triton, ^3He and α-particle emissions and recoil spectra are evaluated based on the Monte-Carlo method. (author).

11636 (JAERI-M–94-019, pp. 310-319) **Evaluation of neutron dosimetry cross sections of ^{59}Co and ^{197}Au up to 50 MeV.** Odano, Naoteru (Ship Research Inst., Tokai, Ibaraki (Japan). Tokai Branch); Iwasaki, Shin. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Dosimetry cross sections of ^{59}Co and ^{197}Au were evaluated based on the nuclear model calculation from threshold to 50 MeV for the application in accelerator based high energy neutron filed provided by ESNIT at JAERI, etc. For the ^{59}Co, the (n,2n), (n,3n), (n,4n), (n,p), (n,α) and (n,2nα) cross sections were evaluated and compared with available experimental data. The helium accumulation dosimetry cross section was also evaluated. For the ^{197}Au, the (n,2n), (n,3n), (n,4n) and helium production cross section were evaluated. Weak activation cross sections, (n,p) and (n,α), were also evaluated. (author).

11637 (JAERI-M–94-019, pp. 320-329) **Dosimetry cross-section evaluation by cubic-B spline fitting.** Iwasaki, S. (Tohoku Univ., Sendai (Japan). Faculty of Engineering). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Several threshold dosimetry cross-sections have been re-evaluated on the basis of experimental data for the upgrade version of JENDL DOSIMETRY FILE. In the evaluation, the experimental data selections from the data base have been done with the aide of a pattern clustering method on the available data. Then the selected data were fitted by a set of cubic B-spline functions using the least-squares method. In the fitting, the selection of number of knots and their positions was important. A suitable guide for this selection was introduced in order to avoid unnecessary oscillation of the fitted curves. The covariance data were simultaneously produced using the estimated correlation data with respect to each data set. The following five dosimetry cross sections have been re-evaluated: $^{23}Na(n,2n)^{22}Na$, $^{54}Mn(n,2n)^{54}Mn$, $^{59}Co(n,2n)^{58}Co$, $^{60}Ni(n,p)^{60}Co$, and $^{93}Nb(n,2n)^{92m}Nb$. (author).

11638 (JAERI-M–94-019, pp. 330-336) **Evaluation of the D(γ,n) reaction cross section.** Murata, T. (Nippon Nuclear Fuel Development Co. Ltd., Oarai, Ibaraki (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Evaluation was performed for the cross section of photodisintegration of Deuteron in the photon energy range between the threshold energy of the reaction (2.224 MeV) and pion production threshold (140 MeV). Angular distributions of the emitted neutrons were also evaluated. (author).

11639 (JAERI-M–94-019, pp. 351-361) **Systematics of the fragmentation cross section for incident proton energies up to 3 GeV.** Shigyo, Nobuhiro (Kyushu Univ., Fukuoka (Japan). Faculty of Engineering); Ishibashi, Kenji; Wakuta, Yoshihisa. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

We study the systematics of fragmentation reaction by the liquid-gas phase transition model, for incident proton energies up to 3 GeV. The formula based on the thermal droplet model is adopted

for representing the experimental kinetic energy spectra. In addition, a simpler formula is successfully introduced for the spectra in this study. The relationship between parameters of two formulas is obtained quantitatively. The same nuclear temperature common to both kinetic energy spectra and mass yields of fragments in useful for describing the fragmentation phenomena. The present systematics are suited for incorporation as a subroutine set into the High Energy Transport Code. (author).

11640 (JAERI-M–94-019, pp. 387-396) **Sensitivities of nuclear data to the nuclear equilibrium state.** Nakamura, Hiroki (Tokyo Inst. of Tech. (Japan). Research Lab. for Nuclear Reactors); Sekimoto, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

As a part of our study on the future society in nuclear equilibrium, sensitivity coefficients of one-group constants were calculated to the infinite multiplication factor and to the nuclide number densities in the reactor using perturbation method. In this calculation four types of reactor which have typical neutron spectrum were considered. (author).

11641 (JINR–3-66-94, pp. 19-29) **Multimodal Fission of Neutron Deficient Nuclides of Th and Ac.** Itkis, M.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions); Oganesyan, Yu.Ts.; Chubaryan, G.; Pashkevich, V.V.; Salamatin, V.S.; Rusanov, A.Ya.; Okolovich, V.N.; Smirenkin, G.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1994. In *JINR Rapid Communications. Collection 3.* 53p. Order Number DE95615980. Source: OSTI; NTIS (US Sales Only); INIS.

Investigations of low-energy fission in reactions ^{204,208}Pb and ^{203}Tl + ^{16}O have been performed with the help of the double-arm time-of-flight fragment spectrometer on the U-400 cyclotron beam, FLNR, JINR. The goal is to obtain experimental information on multimodal structure of mass energy fragment distributions in the field of A fissionable nuclei earlier unstudied. For the first time, with such purpose heavy ion-induced reactions have been used. In connection with the experimental data obtained the influence of nucleon-nuclei composition on principal fission modes -symmetric and asymmetric ones (Y_s/Y_a) - are discussed. (author). 12 refs.; 7 figs.; 1 tab.

11642 (JINR–4-61-93, pp. 13-17) **The first experiments on nuclear reaction studies at the Nuclotron.** Baldin, A.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy); Afanas'ev, S.V.; Anisimov, Yu.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1993. In *JINR rapid communications. Collection.* 75p. Order Number DE95616411. Source: OSTI; NTIS (US Sales Only); INIS.

3 refs.; 5 figs.

The first run at the new superconducting accelerator Nuclotron was carried out in July 1993. The experiment was prepared by SFERA (4Π-detector) and SYaO (nuclear recoil spectrometer) collaborations. The beam of deuterons was accelerated up to 200 MeV per nucleon. The spectra of secondary particles were measured using TOF (time-of-flight) and Δ E-E techniques. The results of this run indicate good perspectives to carry out experiments at internal target. 3 refs.; 5 figs.

11643 (JINR–4-61-93, pp. 36-48) **Cross sections of Bismuth nuclei fission on the secondary beam of He^6.** Skobelev, N.K.; Luk'yanov, S.M.; Tarasov, O.V.; Fomichev, A.S.; Shilov, V.M.; Penionzhkevich, Yu.E.; David, I.; Perelygin, V.P.; Mul'gin, S.I.; Wolski, R. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1993. In *JINR rapid communications. Collection.* 75p. Order Number DE95616411. Source: OSTI; NTIS (US Sales Only); INIS.

24 refs.; 5 figs.

The cross sections for fission of ^{209} Bi induced by secondary beams of ^{6} He and ^{4} He are measured in analogous conditions. There is a good agreement with former published data on fission cross sections. In the case of the reaction^4 He + ^{209} Bi, the cross sections of the fission of ^{209} Bi induced by ^{6} He are significantly higher than the corresponding α-particle induced fission cross section. A large energy shift is observed of the threshold for the fission reaction ^{6} He + ^{209} Bi in comparison with the reaction ^{4} He + ^{2}09 Bi. The analysis of different factors which might be responsible for the observed effect in the fission reaction ^{6} He + ^{2}09 Bi is also presented. 24 refs.; 5 figs.

11644 (JINR–4-61-93, pp. 54-59) **Hot fusion reaction cross sections.** Muzychka, Yu.A.; Pustyl'nik, B.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1993. In *JINR rapid communications. 2 refs.; 4 figs.; 1 tab.

In the frame of the statistical theory of decay of compound nuclei we suggested a simple parametrization which allows for satisfactory reproduction of the complete set of experimental data on the cross sections of (H 1, x n) reactions for the bombarding ions lighter than A<40 and for compound nuclei with Z>100. We came to an observation that the value of the x n-reaction cross section depends besides the Γ_n/Γ_f ratios for each step of the evaporation cascades also on the value of the'survival zone' that is determined completely by the fission barrier. The cross sections of 4 n- and 5 n-reactions are calculated for a number of projectile-target combinations leading to the formation of evaporation residues in the region of heavy trans fermium nuclides. 2 refs.; 4 figs.; 1 tab.

11645 (JINR–6-63-93, pp. 5-12) **Pion momentum spectra in a nuclear charge exchange reaction Mg(t, ^{3} He).** Avramenko, S.A. (and others); Aksinenko, V.D.; Anikina, M.Kh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. In *JINR rapid communications. Collection 6.* 62p. Order Number DE95616386. Source: OSTI; NTIS (US Sales Only); INIS.

The charge exchange reaction Mg(t, ^{3} He) was investigated in an experiment using a streamer chamber. The branching ratios of the reaction channels (topologies) were obtained. The experimental momentum spectrum for pions was compared with the calculated one, and only 50% of pions were shown to be emitted by the delta isobars produced on a quasi-free nucleon in the target nucleus. It was also found that the mass of delta incorporated in the nucleus was reduced by 30-50 MeV in comparison with a free delta. 19refs., 4 figs., 1 tab.

11646 (JINR–6-63-93, pp. 55-62) **Experimental study of super neutron-deficient tin isotopes.** Lewitowicz, M. Collection 6.* 62p. Order Number DE95616386. Source: OSTI; NTIS (US Sales Only); INIS.

Fragmentation reactions analyzed by means of the projectile fragment separator LISE3 at GANIL were exploited to enable the nuclei in the closest neighbourhood of ^{100} Sn to be identified and their decay properties studied. Preliminary results of the first experiments performed with the ^{112} Sn beam are presented. The first identification of ^{102} Sn and confirmation of an existence of ^{101} Sn open new possibilities in the study of nuclei close to ^{100} Sn. 5 refs., 4 figs.

11647 (JINR-E–3-94-316) **Systematics of the Fast Neutron Induced (n, α) Reaction Cross Sections.** Khuukhehnkhuu, G.; Gledenov, Yu.M.; Sedysheva, M.V.; Unehnbat, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 6p. Order Number DE95623764. Source: OSTI; NTIS (US Sales Only); INIS.

Systematic analysis of known experimental cross sections of the (n, α) reaction induced by fast neutrons is carried out for a wide range of mass numbers $19 \leq A \leq 140$ for the target nuclei. The dependence of the (n, α) cross sections on the asymmetry parameter

(N-Z)/A of proton and neutron numbers in the target nucleus is obtained for neutron energies of 8, 10, 14.5 and 16 MeV. 17 refs., 4 figs.

Submitted to Izvestiya Akademii Nauk - Rossijskaya Akademiya Nauk. Seriya Fizicheskaya.

The high energy approximation (HEA-method) in the three-dimensional quasi-classics is applied to one-nucleon transfer reactions with heavy ions. An important role of the classical deflection angle introduced is established. The transition amplitude is obtained in an analytical form. Good agreement with experimental data is obtained at different energies. 8 p., 3 figs.

Submitted to Nuclear Physics. A.

The measurements of different reactions of anti pd annihilation at rest in gaseous target have been performed using the OBELIX spectrometer at LEAR (CERN). Strong deviation from the OZI rule prediction was found from the measurement of the ratio $R = \phi\pi/\omega\pi$ in two regions of proton momenta $p < 200$ MeV/c and $p > 400$ MeV/c: $R(\phi\pi^-/\omega\pi^-)$ $(133\pm26)\cdot 10^{-3}$, $p < 200$ MeV/c; $R(\phi\pi^-/\omega\pi^-)$ $(113\pm30)\cdot 10^{-3}$, $p > 400$ MeV/c. These values are about $\approx$ 30 times greater than the theoretical prediction. For the first time the excitation of the Δ-resonance was observed among the final state products of anti pd annihilation. The existence of a broad enhancement in 4π invariant mass at $m \approx 1480$ MeV seen in previous experiments was confirmed. We also observed the shifting of the bump position at $\approx$ 100 MeV down when the proton momentum increases up to $p > 400$ MeV/c. The positions of ω, ρ and $f_2(1270)$ do not change with the proton momentum. 58 refs., 19 figs., 6 tabs.

11671 (KFK-5386) **Towards a unified description of light ion fusion cross section excitation functions.** Zimmer, K.W.;

Rebel, H. (ed.). Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Kernphysik. Oct 1994. 43p. Order Number DE95756080. Source: OSTI; NTIS (US Sales Only); INIS.

A description of light heavy-ion fusion, taking into account both entrace-channel characteristics and compound-nucleus properties, is derived within a unified theory of nuclear reactions. The dependence of the imaginary fusion potential on the level density of the compound nucleus is revealed. The $^{12}C+^{12}C$, $^{12}C+^{14}N$, $^{10}B+^{16}O$ and $^{16}O+^{16}O$ fusion cross sections are calculated for $E_{cm} \leq 120$ MeV and compared with experimental data. The excitation energy dependence of the level-density parameter of ^{24}Mg, ^{26}Al and ^{32}S is inferred below 5 MeV/A. A realistic nuclear level-density model, describing the experimental level-density parameters of highly excited nuclei, is shown to be consistent with both the global features and details of the fusion cross section. $^{12}C+^{12}C$ and $^{16}O+^{16}O$ fusion cross section oscillations are predicted at large excitation energies, reflecting the structure of the level density of the highly excited light compound nuclei. Differences of the $^{12}C+^{14}N$ and $^{10}B+^{16}O$ fusion reaction mechanisms are discussed in terms of specific entrance-channel characteristics. (orig.)

11672 (LA-UR–95-597) **Measurement of the reaction $C(\nu_{mu},\mu^-)X$ near threshold.** Federspiel, F.J. LSND Collaboration. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940514–20: Intersections of particle and nuclear physics, St. Petersburg, FL (United States), 31 May - 6 jun 1994). Order Number DE95007888. Source: OSTI; NTIS; INIS; GPO Dep.

Using the decay-in-flight ν_μ beam from the Los Alamos Meson Physics Facility and a massive liquid scintillator neutrino detector (LSND), the reaction $C(\nu_\mu,\mu^-)X$ has been studied near threshold. Preliminary results for the visible energy distribution of the final state and the flux integrated cross section are presented and compared with the results of several nuclear model calculations.

11673 (PTB-N–18) **Neutron production by deuteron breakup on ^{4}He.** Schmidt, D. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Neutronenphysik); Xia Haihong. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Neutronenphysik. Oct 1994. 38p. Order Number DE95752041. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron spectra of the deuteron breakup on ^{4}He have been measured at eight deuteron incident energies between 4.7 MeV and 12.1 MeV using the TOF method. The measurements carried out at angles of 0 deg, 5 deg and 10 deg were completed by measurements at 2.5 deg and 7.5 deg at some energies. The cross sections for these angles were reliably interpolated for the other energies. The normalization to absolute cross sections was carried out by reference to the well known data of the DD reaction. When a relative energy scale is introduced the spectral shape is almost angle-independent. It is shown that the use of the deuteron breakup on ^{4}He can considerably refine the correction for the deuteron breakup on deuterium in scattering experiments made with Monte Carlo simulations. (orig.)

11674 (UM-P–93/96) **Quantal inversion of cross-section for the elastic scattering of 200 MeV protons from ^{12}C.** Allen, L.J.; Amos, K.; Dortmans, P.J. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 16p. Order Number DE95620574. Source: OSTI; NTIS (US Sales Only); INIS.

Fixed energy quantal inverse scattering theory has been used to analyse the differential cross-section from the elastic scattering of 200 MeV protons from ^{12}C. Ambiguities in obtaining the scattering function from the differential cross-section are discussed and by means of example it is illustrated that not all scattering functions lead to physically reasonable potentials. 8 refs., 2 tabs., 4 figs.

11675 (UM-P–94/84) **Computational simplifications in pion and kaon induced nucleon knock-on reactions.** Di Marzio, F. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 22p. Order Number DE95619351. Source: OSTI; NTIS (US Sales Only); INIS.

A semi-analytic theory of (K, KN) and (π πN) reactions enabling large basis (microscopic) models of nuclear structure to be employed in correlation analyses is developed. The energy range for validity is outlined and expressions for the transition amplitudes using a modified nuclear density profile and in the plane wave limit are also presented. These proved a computationally efficient method for preliminary investigations of such reactions. 18 refs., 4 figs.

TORT has been in service more than 10 years now. Although the original version was developed for the single purpose of calculating the penetration of radiation into large concrete buildings, more general versions have achieved widespread use and acceptance in many other applications. This paper discusses current features and capabilities of TORT and related peripheral codes.

11677 (CONF-950420–20) **A new algorithm for generating highly accurate benchmark solutions to transport test problems.** Azmy, Y.Y. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. We present a new algorithm for solving the neutron transport equation in its discrete-variable form. The new algorithm is based on computing the full matrix relating the scalar flux spatial moments in all cells to the fixed neutron source spatial moments, foregoing the need to compute the angular flux spatial moments, and thereby eliminating the need for sweeping the spatial mesh in each discrete-angular direction. The matrix equation is solved exactly in test cases, producing a solution vector that is free from iteration convergence error, and subject only to truncation and roundoff errors. Our algorithm is designed to provide method developers with a quick and simple solution scheme to test their new methods on difficult test problems without the need to develop sophisticated solution, e.g. acceleration, algorithms before establishing the worthiness of their innovation. We demonstrate the utility of the new algorithm by applying it to the Arbitrarily High Order Transport Nodal (AHOT-N) method, and using it to solve Burre's Test Problem, a suite of benchmark problems that covers a large region in parameter space. Our results provide highly accurate benchmark solutions, that can be distributed electronically and used to verify the pointwise accuracy of other solution methods and algorithms.

11678 (DOE/ER/25165–T1) **Fast algorithms for transport models. Final report, June 1, 1993–May 31, 1994.** Manteuffel, T. Colorado Univ., Denver, CO (United States). Dept. of Mathematics. Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER25165. Order Number DE95007064. Source: OSTI; INIS; NTIS; GPO Dep.

The focus of this project is the study of multigrid and multilevel algorithms for the numerical solution of Boltzmann models of the transport of neutral and charged particles. In previous work a fast multigrid algorithm was developed for the numerical solution of the Boltzmann model of neutral particle transport in slab geometry assuming isotropic scattering. The new algorithm is extremely fast in the thick diffusion limit; the multigrid v-cycle convergence factor approaches zero as the mean-free-path between collisions approaches zero, independent of the mesh. Also, a fast multilevel method was developed for the numerical solution of the Boltzmann model of charged particle transport in the thick Fokker-Plank limit for slab geometry. Parallel implementations were developed for both algorithms.

11679 (EGG–2744, pp. 55-66) **Creating and using a type of free-form geometry in Monte Carlo particle transport.** Wessol, D.E. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Wheeler, F.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. While the reactor physicists were fine-tuning the Monte Carlo paradigm for particle transport in regular geometries, the computer scientists were developing rendering algorithms to display extremely realistic renditions of irregular objects. With the exception of a few visionaries such as the Mathematical Application Group, Inc. (MAGI), each community was not sufficiently aware of what the other was doing. This common basis included the treatment of neutral particle transport through complicated geometries in three-dimensional space. In one instance, it is called the Boltzmann transport equation, while in the other, it is commonly referred to as the rendering equation. Even though the modeling methods share a common basis, the initial strategies each discipline developed for variant reduction were remarkably different. Initially, the reaction physicist used Russian roulette, importance sampling, particle splitting, and rejection techniques. In the early stages of development, the computer scientist relied primarily on rejection techniques, including a very elegant hierarchical construction and sampling method. This sampling method allowed the computer scientist to viably track particles through irregular geometries in three-dimensional space, while the initial methods developed by the reactor physicists would only allow for efficient searches through analytical surfaces or objects. As time goes by, it appears there has been some merging of the variance reduction strategies between the two disciplines. This is an early incorporation of geometric hierarchical construction and sampling into the reactor physicists' Monte Carlo transport model that permits efficient tracking through nonuniform rational B-spline surfaces in three-dimensional space. After some discussion, the results from this model are compared with experiments and the model employing implicit (analytical) geometric representation.

11680 (ENEA-RT-ERG–94-17) **Implementation of algorithms based on a new electron model in MCNP: Underpinned by Moliere theory.** Guaraldi, R. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Padoani, F. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Oct 1994. 38p. (RT/ERG–94-17). Order Number DE95749694. Source: OSTI; NTIS (US Sales Only).

For several years the Monte Carlo code MCNP has been widely used at ENEA (Italian Agency for New Technologies, Energy and the Environment) both for photon and neutron transport mainly in fixed-source problems. Before MCNP version 4 containing electron transport became available, it was decided to acquire a Monte Carlo electron/photon transport capability, implementing in MCNP algorithms based on a new electron model, underpinned by the multi-scattering theory of Moliere. However, since MCNP4 uses the Goudsmit-Saunderson theory, the two versions may be regarded as complementary. The code, developed at ENEA-Bologna principally for radiation protection and dosimetry applications, was named MCNPE-BO and brief descriptions as well as some benchmarking problems have already been published. This report is intended to give a complete description of the code and the electron algorithm that it employs. A short review of the main differences between MCNPE-BO and MCNP4 and the input parameters is given. Two appendices with a detailed description of the inputs of MCNPE-BO and PEGS, the cross-section pre-processor, are annexed to this report.

11681 (ENEA-RT-INN–94-11) **ENDF/B VI iron validation onpca-replica (H2O/FE) shielding benchmark experiment.** Pescarini, M. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione). ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. May 1994. 35p. (RT/INN–94-11). Order Number DE95749689. Source: OSTI; NTIS (US Sales Only).

The PCA-REPLICA (H2O/Fe) neutron shielding benchmark experiment is analysed using the SN 2-D DOT 3.5 code and the 3-D-equivalent flux synthesis method. This engineering benchmark reproduces the ex-core radial geometry of a PWR, including a mild steel reactor pressure vessel (RPV) simulator, and is dsigned to test the accuracy of the calculation of the in-vessel neutron exposure parameters (fast fluence and iron displacement rates). This accuracy is strongly dependent on the quality of the iron neutron cross section used to describe the nuclear reactions within the RPV simulator. In particular, in this report, the cross sections based on the ENDF/B VI iron data files are tested, through a comparison of the calculated integral and spectral results with the corresponding experimental data. In addition, the present results are compared, on the same benchmark experiment, with those of a preceding ENEA (Italian Agency for Energy, New Technologies and Environment)-Bologna validation of the JEF-2.1 iron cross sections. The integral result comparison indicates that, for all the thresold detectors considered (Rh-103 (n,n) Rh-103m, In-115 (n,n) In-115 (n,n) In-115m and S-32 (n.p) P-32), the ENDF/B VI iron data produce better results than the JEF-2.1 iron data. In particular, in the ENDF/B VI calcultaions, an improvement of the in-vessel C/E (Calculated/Experimental) activity ratios for the lower energy threshold detectors, Rh-103 and In-115, is observed. This improvement becomes more evident with increasing neutron penetration depth in the vessel. This is probably attributable to the fact that the inelastic scattering cross section values of the ENDF/B VI Fe-56 data file, approximately in the 0.86 - 1.5 MeV energy range, are lower then the corresponding values of the JEF-2.1 data file.

11682 (ENEA-RT-INN–94-29) **Soft x-ray sources: Comparison.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Letardi, T. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 23p. (RT/INN–94-29). Order Number DE95749662. Source: OSTI; NTIS (US Sales Only).

This report presents a comparison between the brightness of different sources of soft x-rays, calculating peak and average values. Synchrotron radiation or laser plasma sources as well as less conventional sources is analyzed, exploiting Compton backscattering or harmonic generation processes.

11683 (IFVE-ORI–94-2) **Integrative shell of the program complex MARS (Version 1.0) radiation transfer in three-dimensional geometries.** Degtyarev, I.I.; Lokhovitskij, A.E.; Maslov, M.A.; Yazynin, I.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1994. 9p. (In Russian). Order Number DE95619354. Source: OSTI; NTIS (US Sales Only); INIS.

The first version of integrative shell of the program complex MARS is written for calculating radiation transfer in the three-dimensional geometries. The integrative shell allows the user to work in convenient form with complex MARS, creat input files data and get graphic visualization of calculated functions. Version 1.0 is adapted for personal computers of types IBM-286,386,486 with operative size memory not smaller than 500K. 5 refs.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

A theoretical discussion concerning the evaluation of the temperature dependent Free Gas scattering kernel, for deterministic as well as stochastic calculations, is presented. It is shown that the current procedure for handling neutron scattering in the MCNP Monte Carlo code is in doubt, when one relies on the Free Gas scattering kernel in the low epithermal energy region. It is concluded that a corrected procedure should be compared in detail with the current method in order to determine the magnitude of the differences. One of the main purposes is to enhance the degree of confidence with which the Doppler Effect can be estimated for reactor assemblies with the aid of the MCNP code. (author).

11688 (JAERI-M–94-019, pp. 25-27) **Nuclear data activities at Khlopin Radium Institute, Russia.** Rimski-Korsakov, A.A. (V.G.Khlopin Radium Inst., St. Petersburg (Russian Federation)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Khlopin Radium Institute in St. Petersburg is one of the oldest scientific establishments in Russia to deal with the phenomena of radioactivity, nuclear energy and their applications. The task in 1940s was the measurement of such crucial data as the neutron fission cross sections of uranium isotopes and emitted neutron multiplicity. The first radium-beryllium neutron sources in Russia have been prepared here. In 1937, the first cyclotron in Europe has been built at KRI, that provided the neutron source for nuclear data research. In 1939, the spontaneous fission of ^{238}U was found during the study on the neutron-induced fission of uranium. The dependence of chain fission reaction possibility on fission neutron multiplicity was measured by multiple coincidence neutron counting. The associated particle techniques used with time of flight neutron spectrometry in 1970s enabled high precision neutron spectrometry. The contemporary nuclear data works at KRI are shown. Two most typical examples of nuclear data measurement at KRI are the measurement of 14 MeV neutron reaction cross section and the study of neutron spectra produced in massive targets by GeV protons. These experiments are explained briefly. (K.I.).

11689 (JAERI-M–94-019, pp. 68-78) **JENDL-3 Revision 2.** Nakagawa, Tsuneo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The data for 340 nuclides will be stored in the second revised version of JENDL-3, JENDL-3.2, and about half of them will be modified more or less. An outline of modifications for JENDL-3.2 is described here in particular on double-differential cross sections, total cross sections and inelastic scattering cross sections of structural materials, data of fission product nuclides, resonance parameters and fission spectra of heavy nuclides, and γ-ray production data. (author).

11690 (JAERI-M–94-019, pp. 95-103) **Shielding experiments with quasi-monoenergetic several tens MeV neutrons at 90 MV AVF cyclotron facility TIARA.** Nakamura, Takashi (Tohoku Univ., Sendai (Japan). Cyclotron and Radioisotope Center). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The research programme has started as a cooperative project between Japan Atomic Energy Research Institute (JAERI) and several universities to acquire the cross section and shielding data for 15 to 90 MeV neutrons by using a p-Li quasi-monoenergetic neutron field established at 90 MV AVF cyclotron facility, TIARA in JAERI. In the present stage, we obtained some preliminary experimental results on neutron penetration and charged particle production and activation cross sections. (author).

11691 (JAERI-M–94-019, pp. 362-368) **Integral test of secondary gamma-ray production cross sections of iron in JENDL-3 with continuous energy Monte Carlo analysis.** Ueki, Kohtaro (Ship Research Inst., Mitaka, Tokyo (Japan)); Ohashi, Atsuto; Yamano, Naoki. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

Integral test of secondary gamma-ray production cross sections of iron in JENDL-3 was carried out with the continuous energy Monte Carlo analysis for the K and K iron secondary gamma-ray benchmark experiment. In the present analysis the 0.847 MeV peak was investigated in detail. At the peak, the large discrepancy was observed between the results with JENDL-3 and ENDF/B-IV data. The peak could not reproduced and an incomprehensive peak was appeared around 0.7 MeV with JENDL-3 data. Taking advantage of the Monte Carlo results, the iron secondary gamma-ray production cross sections were revised and the new data was proposed to JENDL-3.2. Consequently, the Sn calculations with the revised iron cross sections reproduced the 0.847 MeV peak quite well as with ENDF/B-IV data. However, the peak around 8 MeV was disappeared completely with the revised data. (author).

11692 (JINR-E-3-93-61, pp. 23-28) **Energy loss and mean ranges of ^{129}Xe and ^{209}Bi in aluminium and Kapton.** Dwbdeni, K.K. (and others). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. (CONF-9203318--: 2. international workshop on solid state nuclear track detectors and their applications, Dubna (Russian Federation), 24-26 Mar 1992). In *2. International Workshop Solid State Nuclear Track Detectors and their Applications.* 205p. Order Number DE95620429. Source: OSTI; NTIS (US Sales Only); INIS.

The energy loss and mean ranges of 13.0 MeV/n ^{129}Xe and ^{209}Bi have been measured in aluminium and Kapton polyimide using a nuclear track technique.

11693 (JINR-E-3-93-65, pp. 69-79) **Time-of-flight Fourier spectroscopy with polarized neutron beams.** Ignatovich, V.K. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

Principles of pseudo random (PR) and Fourier Spectroscopy for pulsed and stationary neutron sources are reconsidered. Application to polarized beams is discussed. Correlation functions are obtained for PR and Fourier spectroscopy. 8 refs.

11694 (JINR-R-13-94-312) **Neutron Beam Energy Spectrum Measurement in the 5H Channel of the Serpukhov Accelerator.** Aleev, A.N. (and others); Balandin, V.P.; Bragadireanu, A. EXCHARM Collaboration: Dubna-Alma-Ata-Bucharest-Minsk-Moscow-Prague-Serpukhov-Sofia-Tbilisi. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 16p. (In Russian). Order Number DE95623802. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Pribory i Tekhnika Ehksperimenta.

The method of neutron beam energy measurement using hadron calorimeter (HC) is described. The energy spectrum of neutrons is reconstructed using HC data and apparatus function representation. The calculations are based on the so-called regularization method. The energy spectrum of neutrons produced by 70 GeV protons in the beam channel 5H has been measured using the proposed method. The energy spectrum of neutrons produced by 50 GeV protons has been calculated as well. Obtained spectra are used for research of strange and charmed particles and exotic hadrons carried on in the EXCHARM experiment. (author). 11 refs., 9 figs.

11695 (LA-12887) **MCNP™ ENDF/B-VI validation: Infinite media comparisons of ENDF/B-VI and ENDF/B-V.** Court, J.D.; Hendricks, J.S.; Frankle, S.C. Los Alamos National Lab., NM (United States). Dec 1994. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007168. Source: OSTI; NTIS; INIS; GPO Dep.

Infinite media calculations have been performed to validate the new MCNP ENDF/B-VI Library, ENDF60. All 124 nuclides have neutron flux and heating tallies compared against ENDF/B-V, as well as the MCNP Recommended Data Sets when these were not ENDF/B-V. For nuclides with photon production, photon flux and heating tallies have also been compared. All significant differences between the new ENDF60 results and those obtained with other data sets are discussed. This report provides a method for data comparison so that a better decision can be made as to the best data set to be used for a particular problem.

11696 (LA-12891) **ENDF/B-VI data for MCNP™.** Hendricks, J.S.; Frankle, S.C.; Court, J.D. Los Alamos National Lab., NM (United States). Dec 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007169. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear and atomic data are the foundation upon which the radiation transport codes are built. For neutron transport the international standard is the Evaluated Nuclear Data File from Brookhaven National Laboratory. The latest version, ENDF/B-VI release 2, has recently become available for use in the Monte Carlo N-Particle (MCNP) radiation transport code. These neutron cross-section data are designated by ZAID identifiers ending in .60c and are referred to as the ENDF60 library. The ENDF60 data library was processed from the ENDF/B-VI evaluations using the NJOY code. Fifty-two percent of the data evaluations are translations from ENDF/B-V. The remaining 48% are new evaluations which have sometimes changed significantly. The RSIC release package contains the ENDF60 neutron library, a new photon library MCPLIB02, the electron library EL1, and an updated XSDIR file. The authors report here the work done by the LANL Radiation Transport Group (X-6) in testing and validating the ENDF60 data library and in developing the necessary new sampling and detector schemes. When the ENDF60 library should be used in preference to the previous libraries, is also considered. The development of the new photon library MCPLIB02 is also discussed.

11697 (LA-UR-95-182) **Supertrack Monte Carlo variance reduction experience for non-Boltzmann tallies.** Estes, G.P.; Booth, T.E. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420--16: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95006329. Source: OSTI; NTIS; INIS; GPO Dep.

This paper applies a recently developed variance reduction technique to the first principles calculations of photon detector responses. This technique makes possible the direct comparison of pulse height calculations with measurements without the need for unfolding techniques. Comparisons are made between several experiments and the calculations to demonstrate the utility of the supertrack Monte Carlo technique for reproducing and interpreting experimental count rate spectra.

11698 (UCRL-JC-118606) **Mathematical models for volume rendering and neutron transport.** Max, N. Lawrence Livermore National Lab., CA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411189--1: 2. workshop on super simulators for power plants, Tokyo (Japan), 2 Nov 1994). Order Number DE95006338. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reviews several different models for light interaction with volume densities of absorbing, glowing, reflecting, or scattering material. They include absorption only, glow only, glow and absorption combined, single scattering of external illumination, and multiple scattering. The models are derived from differential equations, and illustrated on a data set representing a cloud. They are related to corresponding models in neutron transport. The multiple scattering model uses an efficient method to propagate the radiation which does not suffer from the ray effect.

11699 (WAPD-T-3013) **An approximate algorithm for the flux from a rectangular volume source.** Wallace, O.J. Westinghouse Electric Corp., West Mifflin, PA (United States). Bettis Atomic Power Lab. 9 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-950420--11: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95003030. Source: OSTI; NTIS; INIS; GPO Dep.

An exact semi-analytic formula for the flux from a rectangular surface source with a slab shield has been derived and the required function table has been calculated. This formula is the basis for an algorithm which gives a good approximation for the flux from a rectangular volume source. No other hand calculation method for this source geometry is available in the literature.

6640 Atomic and Molecular Physics

11700 (ANL/PHY/CP-85306) **Electron spectroscopy studies of argon K-shell excitation and vacancy cascades.** Southworth, S.H. (National Institute of Standards and Technology, Gaithersburg, MD (United States)); MacDonald, M.A.; LeBrun, T.; Azuma, Y.; Cooper, J.W. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9404198--5: Workshop on atomic physics at high brilliance synchrotron sources, Argonne, IL

(United States), 23-24 Apr 1994). Order Number DE95007096. Source: OSTI; NTIS; INIS; GPO Dep.

Electron spectroscopy combined with tunable synchrotron radiation has been used for studies of Ar K-shell excitation and vacancy decay processes. In addition, electrons and fluorescent X-rays have been recorded in coincidence to select subsets of the ejected electron spectra. Examples are presented for Ar 1s photoelectrons and KLL and LMM Auger spectra.

Helium single ionization by 3.6 MeV/u Ni^{24+} impact was explored in a kinematically complete experiment by combining a high-resolution recoil-ion momentum spectrometer with a novel 4π low-energy electron analyzer. More than 90% of the "soft electrons" (E_e> or $\approx$50 eV) are ejected in the forward direction in agreement with CTMC predictions. The electron longitudinal momentum is not balanced by the longitudinal momentum change of the projectile but mainly by the backwards recoiling He^{1+}-ion. Energy losses of the 0.2 GeV projectiles as small as $\Delta E_P/E_P=3.4.10^{-7}$ are observable. (orig.)

Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international symposium on resonance ionization spectroscopy and its applications; Bernkastel-Kues (Germany); 3-8 Jul 1994. Order Number DE95007011. Source: OSTI; NTIS; INIS; GPO Dep.

Multiphoton ionization coupled with mass spectrometry was used to investigate molecular cluster distributions. Three examples will be discussed in this presentation. First, in studies of neat nitric oxide clusters, $(NO)_m$, an interesting odd-even intensity alternation was observed and will be discussed in terms of electron-pairing considerations. In a separate study, the binary clusters comprising nitric oxide and methane preferentially form a stoichiometric cluster made up of repeating units of $(NO)_2CH_4$. These presumably represent a particularly strongly bound "van der Waals" subunit. Finally, in similar studies of neat carbon disulfide clusters, $(CS_2)_m$, additional photon absorption after the two-photon ionization step stimulates a series of intracluster ion-molecular reactions leading to formation of S_m^+ and $(CS)_m^+$ polymers, as well as intermediate species such as S_m^+ (CS_2). This molecular cluster analogue of "laser snow" will be described in detail.

The second order nonlinear optical processes of second harmonic generation and sum frequency generation are powerful and versatile tools for studying all kinds of surfaces. They possess unusual surface sensitivity due to the symmetry properties of the second order nonlinear susceptibility. The technique of infrared-visible sum frequency generation (SFG) is particularly attractive because it offers a viable way to do vibrational spectroscopy on any surfaces accessible to light with submonolayer sensitivity. In this thesis, the author applies SFG to study a number of important water interfaces. At the air/water interface, hydrophobic solid/water and liquid/water interfaces, it was found that approximately 25% of surface water molecules have one of their hydrogen pointing away from the liquid water. The large number of unsatisfied hydrogen

bonds contributes significantly to the large interfacial energy of the hydrophobic surfaces. At the hydrophilic fused quartz/water interface and a fatty acid monolayer covered water surface, the structure and orientation of surface water molecules are controlled by the hydrogen bonding of water molecules with the surface OH groups and the electrostatic interaction with the surface field from the ionization of surface groups. A change of pH value in the bulk water can significantly change the relative importance of the two interactions and cause a drastic change in orientation of the surface water molecules. SFG has also been applied to study the tribological response of some model lubricant films. Monolayers of Langmuir-Blodgett films were found to disorder orientationaly under mildly high pressure and recover promptly upon removal of the applied pressure.

Magnetic structure determination (description of the microscopic arrangement of magnetic moments in a crystal) requires neutron diffraction studies. Some examples are given of the powder technique, applied to long range magnetic order determination in localized magnetism systems: RT_2X_2, whith R=lanthanide or uranium, T=3d transition metal, X=Si or Ge; R_2In, with R=lanthanide; $CuGeO_3$. 15 refs., 9 figs., 3 tabs.

11714 (JINR-E–3-93-65, pp. 128-137) **The application of high-resolution neutron powder diffraction in the study of phase transitions in hydrogen-bonded systems.** Belushkin, A.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Ibberson, R.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225–: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

Recent experimental results are presented that demonstrate the power of high-resolution time-of-flight neutron powder diffraction in the solution of problems concerning the mechanism of phase transitions in hydrogen-bonded systems. The unique advantages of the method are discussed with reference to the high temperature superionic phase transition in $CsDSO_4$ and the low temperature antiferroelectric transition in $Cs_3D(SeO_4)_2$. 21 refs., 4 figs., 1 tab.

11715 (JINR-E–3-93-65, pp. 138-145) **New applications of diffraction topography. Visualization of defects in HTSC and of magnetoelastic waves in weak ferromagnets.** Kvardakov, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Somenkov, V.A.; Shil'stein, S.Sh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225–: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the work was to study the dynamic (borate crystals) and static (cuprate crystals) defects by means of neutron diffraction topography method. Narrow resonance peaks testifying to magnetoelactic waves in $FeBO_3$ were revealed. The extinction contrast was observed on neutron topographs of less perfect

$Nd_{2-x}Ce_xCuO_4$ crystals. The light bands corresponded to the crystal sections where dislocations have formed small-angle boundaries. 11 refs., 5 figs.

11716 (JINR-E-3-93-65, pp. 254-260) **Effects of inelastic scattering in the measurement and analysis of SANS data.** Rennie, A.R.; Heeman, R.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes some data which demonstrates that the scattering from many hydrogenous materials is highly inelastic and extends to a variety of different wavelengths. The consequences of this behaviour for interpretation of data are discussed. Neutron small-angle inelastic scattering measurements are made for colloids, metals, synthetic and biological polymers and for composite materials. 9 refs., 3 figs.

11717 (JINR-E-3-93-65, pp. 261-277) **Neutron-structure investigation of lattice effects of the fluctuated valency in Re_2CuO_4(Re=Nd, Sm).** Trounov, V.A.; Chernyshov, D.Yu.; Matveev, A.V.; Ul'yanov, V.A.; Malyshev, A.L.; Kurbakov, A.I.; Krutov, G.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the structural studies of the powder Re_2CuO_4(Re=Nd, Sm) whithin the temperature range 20-300 K are presented. The measurements were carried out with the high resolution neutron powder diffractometer 'MiniSfinks'. The sensitivity of the experiment, for the Cu-O fragment, was increased applying a mixture of ^{154}Sm, ^{152}Sm ('O-matrix') and ^{144}Nd. Values of the lattice constants and thermal parameters of Cu and O, obtained from profile analysis of the experimental spectra, are given. 19 refs., 10 figs., 1 tab.

11718 (JINR-E-3-93-65, pp. 278-284) **The effect of high frequency ultrasound on the diffraction of thermal neutrons in a bent silicon single crystal. The Bragg case.** Iolin, E.M.; Raitman, E.A.; Gavrilov, V.N.; Kuvaldin, B.V.; Alexandrov, Yu.A.; Sedlakova, L.N.; Loshkarev, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

It has been shown that in the case of Bragg geometry of neutron scattering the transition between sheets of DS take place in bent crystals under US excitation. This leads to various manifestations of the behaviour of the integral scattering intensity which differ from the case of a perfect crystal. 4 refs., 6 figs.

11719 (JINR-E-3-93-65, pp. 285-306) **Real-time neutron diffraction study of phase transitions in the Ti-D system after high pressure treatment.** Kolesnikov, A.I. (AN SSSR, Chernogolovka (Russian Federation). Inst. Fiziki Tverdogo Tela); Bashkin, I.O.; Fedotov, V.K.; Malyshev, V.Yu.; Ponyatovsky, E.G.; Balagurov, A.M.; Mironova, G.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225--: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

Phase transformations in $TiD_{\approx 0.75}$ subjected to high-pressure treatment were investigated by simultaneous real-time measurements of neutron diffraction and small-angle neutron scattering. The neutron spectra were taken on heating the samples in temperature ranges 100 to 300 K and 300 to 870 K. A sequence of structural transitions was observed, which involves 7 different phases and intermediate states with hcp, fcc, fco or bcc metal sublattices and hydrogen atoms. 30 refs., 9 figs., 1 tab.

11720 (JINR-E-14-94-334) **Damage Formation in Silicon Irradiated by Heavy Ions with Energy More than 1 MeV/a.m.u.** Adawi, M.A. (National Research Centre, Cairo (Egypt)); Didyk, A.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1994. 11p. Order Number DE95623968. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Symposium on Advances in Materials Science, Cairo, Egypt, 1994.

The experimental data of the optical reflection coefficient along the projective range of ions ^{40} Ar (46,3 MeV) and ^{22} Ne (26,7 MeV) are presented. The change of silicon lattice constants irradiated by heavy ions was studied with the use of X-ray diffraction method. The estimations of the track diameter for different ions are carried out. 5 refs., 7 figs.

11721 (SAND-94-1885C) **Material analysis using combined elastic recoil detection and Rutherford/enhanced Rutherford backscattering spectrometry.** Burkhart, J.H. (Idaho State Univ., Pocatello, ID (United States)); Barbour, J.C. Sandia National Labs., Albuquerque, NM (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941129--12: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95005415. Source: OSTI; INIS; NTIS; GPO Dep.

Three complimentary ion beam techniques will be combined in the analysis of oxide and nitride based materials, in particular BN/SiC and $La_{0.85}Sr_{0.15}CoO_3$. These materials can be synthesized over composition ranges which vary the physical and electrical properties, and therefore an accurate measure of the composition profiles is critical for controlling these properties. Elastic Recoil Detection (ERD) revealed the composition of light elements from H to 0, and Rutherford Backscattering Spectrometry (RBS) gave the composition of heavier elements (e.g., Si, Sr, Co and La). Enhanced Rutherford Backscattering Spectrometry (FRBS) complimented these techniques by utilizing enhanced cross-sections, greater than Rutherford, to increase the signal-to-noise ratio for analysis of mid-range elements 0, C, and N. ERD with 24 MeV Si ions gave profiles for H, B, and N in thin films, and 30 MeV Si was able to profile 0 in the top portion of heavier samples. Although 2.8 MeV He RBS worked well for heavier elements, ERBS utilized He ions at 3.5 MeV for N analysis and 8.7 MeV for 0 analysis, because at these energies the cross sections are 2 and 22 times Rutherford, respectively. Also, the depth of analysis was greater with ERBS because of the increased incident energy.

The heavy-ion induced damage of monocrystalline binary semiconductors GaP and PnS is studied using the blocking and channeling technique and the conclusion is made about the nontrivial role of the electronic stopping power.

11726 (NEI-DK–1809) **Interaction of hydrogen and oxygen with bulk defects and surfaces of metals.** Besenbacher, F. Aarhus Univ. (Denmark). Inst. for Fysik og Astronomi; Aarhus Univ. (Denmark). May 1994. 113p. Order Number DE95620638. Source: OSTI; NTIS; INIS.

The thesis deals with the interaction of hydrogen with defects in metals and the interaction of hydrogen and oxygen with metal surfaces studied by ion-beam techniques and scanning tunneling microscopy (STM), respectively. The first part of the thesis discusses the interaction of hydrogen with simple defects in transition metals. The trap-binding enthalpies and the lattice location of hydrogen trapped to vacancies have been determined, and an extremely simple and versatile picture of the hydrogen-metal interaction has evolved, in which the trap strength is mainly determined by the local electron density. Any dilution of the lattice will lead to a trap, vacancies and voids being the strongest trap. It is found that hydrogen trapped to vacancies in fcc metals is quantum-mechanically delocalized, and the excitation energies for the hydrogen in the vacancy potential are a few MeV only. The interaction of hydrogen with metal surfaces is studied by the transmission channeling (TC) technique. It is found that hydrogen chemisorbs in the highest-coordinated sites on the surfaces, and that there is a direct relationship between the hydrogen-metal bond length and the coordination number for the hydrogen. In the final part of the thesis the dynamics of the chemisorption process for oxygen and hydrogen on metal surfaces is studied by STM, a fascinating and powerful technique for exploring the atomic-scale realm of surfaces. It is found that there is a strong coupling between the chemisorption process and the distortion of the metal surface. The adsorbates induce a surface reconstruction, i.e. metal-metal bond breaks and metal-adsorbate bounds form. Whereas hydrogen interacts weakly with the metals and induces reconstructions where only nnn metals bonds are broken, oxygen interacts strongly with the metal, and the driving force for the O-induced reconstructions appears to be the formation of low-coordinated metal-O rows, formed by breaking of nn metal bonds.

11727 (OEFZS–4710) **Behaviour of backsputtered contaminations on liquid metal indium ion emitters.** Ruedenauer, F.G.; Fehringer, H.M.; Sieber, A.; Steiger, W. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Feb 1994. 21p. Order Number DE95624011. Source: OSTI; NTIS (US Sales Only); INIS.

The surface of an operating liquid metal ion source (LMIS) is contaminated by material, backsputtered from beam forming electrodes. For an indium - LMIS, operating against steel electrodes, a solid crust is forming at the originally liquid metal surface. Since the LMIS nevertheless continues to operate, topmost 20-50 μm of the emitter surface however must however remain liquid. (authors).

11728 (OEFZS–4713) **The operating behaviour of indium-liquid metal ion emitters, operated against Bi-electrodes.** Sieber, A.; Fehringer, H.M.; Ruedenauer, F.; Steiger, W. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Feb 1994. 34p. (In German). Order Number DE95624012. Source: OSTI; NTIS (US Sales Only); INIS.

The operating behaviour of indium - liquid metal ion emitters, operated against Bi - electrodes, has been investigated. Contamination of the liquid indium film by backsputtered Bi lowers the melting point of the contaminated indium. Therefore, a deterioration of the operating characteristics is not expected. Surprisingly however, the firing voltage of the emitter increases quickly with operating time, until after about 700 μAh a practical voltage limit of 10 kV is exceeded. A microanalytical investigation shows that the thickness of the liquid metal film decreases quickly and the tip area gets almost completely de-wetted. (authors).

11729 (SAND–94-1736C) **Reciprocal space analysis of the microstructure of luminescent and nonluminescent porous silicon films.** Lee, S.R.; Barbour, J.C.; Medernach, J.W.; Stevenson, J.O.; Custer, J.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–42: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005420. Source: OSTI; NTIS; INIS; GPO Dep.

The microstructure of anodically prepared porous silicon films was determined using a novel X-ray diffraction technique. This technique uses double-crystal diffractometry combined with position-sensitive X- ray detection to efficiently and quantitatively image the reciprocal space structure of crystalline materials. Reciprocal space analysis of newly prepared, as well as aged, p^- porous silicon films showed that these films exhibit a very broad range of crystallinity. This material appears to range in structure from a strained, single-crystal, sponge-like material exhibiting long-range coherency to isolated, dilated nanocrystals embedded in an amorphous matrix. Reciprocal space analysis of n^+ and p^+ porous silicon showed these materials are strained single-crystals with a spatially-correlated array of vertical pores. The vertical pores in these crystals may be surrounded by nanoporous or nanocrystalline domains as small as a few nm in size which produce diffuse diffraction indicating their presence. The photoluminescence of these films was examined using 488 nm Ar laser excitation in order to search for possible correlations between photoluminescent intensity and crystalline microstructure.

11730 (USIP–94-03) **Sampling procedures using optical-data and partial wave cross sections in a Monte Carlo code for simulating kilovolt electron and positron transport in solids.** Fernandez-Varea, J.M. (Univ. de Barcelona and Societat Catalana de Fisica IEC, Barcelona (Spain). Facultat de Fisica); Salvat, F.; Liljequist, D. Stockholm Univ. (Sweden). Dept. of Physics. Sep 1994. 35p. Order Number DE95620639. Source: OSTI; NTIS; INIS.

The details of a Monte Carlo code for computing the penetration and energy loss of electrons and positrons in solids are described. The code, intended for electrons and positrons with energies from $\approx$ 100 eV to $\approx$ 100 keV, is based on the simulation of individual elastic and inelastic collisions. Elastic collisions are simulated using differential cross sections computed by the relativistic partial wave method applied to a muffin-tin Dirac-Hartree-Fock-Slater potential. Inelastic collisions are simulated by means of a model based on optical and photoelectric data, which are extended to the non-zero momentum transfer region by means of somewhat different algorithms for valence electron excitations and inner-shell excitations. This report focuses on the description of detailed formulae and sampling methods. 10 refs, 3 figs, 8 tabs.

6654 Quantum Physics Aspects of Condensed Matter

11731 (ENEA-RT-INN–94-24) **Quantum statistical approach to H(D)-Pd system: Evaluation of thermodynamical functions of state from experimental data.** De Ninno, A. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); La Barbera, A.; Violante, V.; Bertalot, L. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jun 1994. 20p. (RT/INN–94-24). Order Number DE95749665. Source: OSTI; NTIS (US Sales Only).

A thermodynamical approach to the hydrogen (deuterium) in palladium system was used to calculate some important features, such as chemical potential and diffusion coefficient behaviour, for variable concentrations of H(D) atoms in a Pd lattice. The difference between the two isotopes was taken into account, assuming a different quantum statistics for low concentrations. The calculation results were compared with the experimental data, where possible, and a satisfactory agreement was found for the diffusion-coefficient behaviour. Some suggestions are given on facing the debated problem of the inverse isotopic effect.

The authors review the extensive evidence from model calculations that neutral holes in an antiferromagnet separate into hole-rich and hole-poor phases. All known solvable limits of models of holes in a Heisenberg antiferromagnet exhibit this behavior. The authors show that when the phase separation is frustrated by the introduction of long-range Coulomb interactions, the typical consequence is either a modulated (charge density wave) state or a superconducting phase. The authors then review some of the strong experimental evidence supporting an electronically-driven phase separation of the holes in the cuprate superconductors and the related Ni oxides. Finally, the authors argue that frustrated phase separation in these materials can account for many of the anomalous normal state properties of the high temperature superconductors and provide the mechanism of superconductivity. In particular, it is shown that the T-linear resistivity of the normal state is a paraconductivity associated with a novel composite pairing, although the ordered superconducting state is more conventional.

Source: OSTI; NTIS; INIS; GPO Dep.

A method has been outlined for calculating the flux front profile for a superconducting sample in either a uniform or nonuniform applied magnetic field possessing azimuthal symmetry. This technique relies upon finding a surface with zero vector potential. This surface is determined by simple integration of its derivative with respect to the external field, found by resolving a linear integral equation of the first kind. Measurement induced voltages and the entire hysteresis loop response can be found by extension of the ZFC magnetization response with increasing external field. Other experimentally measured quantities relating to the critical state can be calculated directly from the hysteresis loop if the time dependence of the external field is known. The technique shown in this report for solving the critical state model in the Bean approximation can be extended to field-dependent critical currents and other azimuthally symmetrical external fields. This work is presently in progress.

Two types of high temperature superconductor films have been prepared by diode sputtering in a high oxygen atmosphere and subsequent in situ annealing in oxygen. Both, the $YBa_2Cu_3O_{7-\delta}$ and $Bi_2Sr_2CaCu_2O_{8+\delta}$-films, showed an excellent c-axis orientation, as verified by X-ray diffraction and Rutherford backscattering spectrum measurements. The rocking curve of $YBa_2Cu_3O_{7-\delta}$ showed a full width at half maximum value (FWHM) of 0.17 , and $Bi_2Sr_2CaCu_2O_{8+\delta}$ showed 0.15 . The minimum yield of the channeling measurements is lower then 2% for $YBa_2Cu_3O_{7-\delta}$, and 9% for $Bi_2Sr_2CaCu_2O_{8+\delta}$. The minimum yield for the Bi-superconductor is higher because of its incommensurable structure in the BiO-plane. The magnetic properties of the films were measured with a SQUID-magnetometer. Both kinds of films have the same critical temperature of approximately 91 Kelvin. However, the zero-field-cooled suscebilities for both cases were quite different: for fields of about B = 0.1 mT the transition curve is broaden for $Bi_2Sr_2CaCu_2O_{8+\delta}$ in contrast to the curves of the $YBa_2Cu_3O_{7-\delta}$-films. Critical current estimations done with a SQUID-magnetometer yielded for $YBa_2Cu_3O_{7-\delta}$-films at 5 K $J_C(5K) = 6.0\ 10^7$ A/cm^2, and at 77 Kelvin $J_C(77K) = 3.7\ 10^6$ A/cm^2, for $Bi_2Sr_2CaCu_2O_{8+\delta}$ at 5 K $J_C(5K) = 1.0\ 10^7$ A/cm^2, at 77 K $J_C(77K) = 1.0\ 10^4$ A/cm^2. The different behaviour of both samples in an external magnetic field can be explained by a strong different anisotropy of the superconducting properties. (orig.)

(CONF-9406310–1: Physics: the opening to complexity, Irvin, CA (United States), Jun 1994). Order Number DE95005277. Source: OSTI; NTIS; INIS; GPO Dep.

The heavy Fermions are a subset of the f-element intermetallics straddling the magnetic/non-magnetic boundary. Their low temperature properties are characterized by an electronic energy scale of order 1–10 K. Among the low temperature ground states observed in heavy Fermion compounds are exotic superconductors and magnets, as well as unusual semiconductors. We review here the current experimental and theoretical understanding of these systems.

11775 (UM-P–93/78) **The non-relativistic charged Bose gas in a magnetic field I. Formalism.** Kowalenko, V.; Frankel, N.E. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 27p. Order Number DE95619698. Source: OSTI; NTIS (US Sales Only); INIS.

The polarisation tensor for the non-relativistic charged Bose gas (CBG) in a uniform magnetic field (B) is derived by using a gauge-independent second-quantised Hamiltonian approach in the random phase or one loop approximation. The tensor's gauge invariant and symmetry properties are used to develop expressions for the dielectric tensor, the longitudinal dielectric response function and the transverse dielectric response functions corresponding to photon propagation perpendicular and parallel to the magnetic field, so that detailed examinations of both the longitudinal and transverse properties of the system at T=0 K and at finite temperature may follow. 17 refs.

11777 (CONF-9004159–9) **Dynamic load balancing in a concurrent plasma PIC code on the JPL/Caltech Mark III hypercube.** Liewer, P.C. (Jet Propulsion Lab., Pasadena, CA (United States)); Leaver, E.W.; Decyk, V.K.; Dawson, J.M. Jet Propulsion Lab., Pasadena, CA (United States). [1990]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-84ER53173. From 5. distributed memory computing conference; Charleston, SC (United States); 8-12 Apr 1990. Order Number DE95005528. Source: OSTI; NTIS; INIS; GPO Dep.

Dynamic load balancing has been implemented in a concurrent one-dimensional electromagnetic plasma particle-in-cell (PIC) simulation code using a method which adds very little overhead to the parallel code. In PIC codes, the orbits of many interacting plasma electrons and ions are followed as an initial value problem as the particles move in electromagnetic fields calculated self-consistently from the particle motions. The code was implemented using the GCPIC algorithm in which the particles are divided among processors by partitioning the spatial domain of the simulation. The problem is load-balanced by partitioning the spatial domain so that each partition has approximately the same number of particles. During the simulation, the partitions are dynamically recreated as the spatial distribution of the particles changes in order to maintain processor load balance.

11778 (CONF-940630–54) **Evaluation of current drive requirements and operating characteristics of a high bootstrap fraction advanced tokamak reactor.** Houlberg, W.A.; Attenberger, S.E. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 11. topical meeting on the technology of fusion energy; New Orleans, LA (United States); 19-24 Jun 1994. Order Number DE95007041. Source: OSTI; NTIS; INIS; GPO Dep.

The reactor potential of some advanced physics operating modes proposed for the TPX physics program are examined. A moderate aspect ratio (A = 4.5 as in TPX), 2 GW reactor is analyzed because of its potential for steady-state, non-inductive operation with high bootstrap current fraction. Particle, energy and toroidal current equations are evolved to steady-state conditions using the 1-1/2-D time-dependent WHIST transport code. The solutions are therefore consistent with particle, energy and current sources and assumed transport models. Fast wave current drive (FWCD) provides the axial seed current. The bootstrap current typically provides 80-90% of the current, while feedback on the lower hybrid current drive (LHCD) power maintains the total current. The sensitivity of the plasma power amplification factor, $Q \equiv P_{fus}/P_{aux}$, to variations in the plasma properties is examined. The auxiliary current drive power, $P_{aux} = P_{LH} + P_{FW}$; bootstrap current fraction: current drive efficiency; and other parameters are evaluated. The plasma is thermodynamically stable for the energy confinement model assumed (a multiple of ITER89P). The FWCD and LHCD sources provide attractive control possibilities, not only for the current profile, but also for the total fusion power since the gain on the incremental auxiliary power is typically 10-30 in these calculations when overall $Q \approx 30$.

11779 (CONF-9407126–3) **Parallel plasma fluid turbulence calculations.** Leboeuf, J.N.; Carreras, B.A.; Charlton, L.A.; Drake, J.B.; Lynch, V.E.; Newman, D.E.; Sidikman, K.L.; Spong, D.A. symposium; Rockville, MD (United States); 12 Jul 1994. Order Number DE95006741. Source: OSTI; NTIS; INIS; GPO Dep.

The study of plasma turbulence and transport is a complex problem of critical importance for fusion-relevant plasmas. To this day, the fluid treatment of plasma dynamics is the best approach to realistic physics at the high resolution required for certain experimentally relevant calculations. Core and edge turbulence in a magnetic fusion device have been modeled using state-of-the-art, nonlinear, three-dimensional, initial-value fluid and gyrofluid codes. Parallel implementation of these models on diverse platforms–vector parallel (National Energy Research Supercomputer Center's CRAY Y-MP C90), massively parallel (Intel Paragon XP/S 35), and serial parallel (clusters of high-performance workstations using the Parallel Virtual Machine protocol)–offers a variety of paths to high resolution and significant improvements in real-time efficiency, each with its own advantages. The largest and most efficient calculations have been performed at the 200 Mword memory limit on the C90 in dedicated mode, where an overlap of 12 to 13 out of a maximum of 16 processors has been achieved with a gyrofluid model of core fluctuations. The richness of the physics captured by these calculations is commensurate with the increased resolution and efficiency and is limited only by the ingenuity brought to the analysis of the massive amounts of data generated.

11780 (CONF-940933–26) **Energetic particle destabilization of shear Alfven waves in stellarators and tokamaks.** Spong, D.A. (Oak Ridge National Lab., TN (United States)); Carreras, B.A.; Hedrick, C.L.; Leboeuf, J.N.; Weller, A. Oak Ridge National Lab., TN (United States). [1994]. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (IAEA-CN–60/D-P-II-3). From 15. international conference on plasma physics and controlled nuclear fusion research; Seville (Spain); 26 Sep - 1 oct 1994. Order Number DE95006393. Source: OSTI; NTIS; INIS; GPO Dep.

An important issue for ignited devices is the resonant destabilization of shear Alfven waves by energetic populations. These instabilities have been observed in a variety of toroidal plasma experiments in recent years, including: beam-destabilized toroidal Alfven instabilities (TAE) in low magnetic field tokamaks, ICRF destabilized TAE's in higher field tokamaks, and global Alfven instabilities (GAE) in low shear stellarators. In addition, excitation and study of these modes is a significant goal of the TFIR-DT program and a component of the ITER physics tasks. The authors have developed a gyrofluid model which includes the wave-particle resonances necessary to excite such instabilities. The TAE linear mode structure is calculated nonperturbatively, including many of the relevant damping mechanisms, such as: continuum damping, non-ideal effects (ion FLR and electron collisionality), and ion/electron Landau damping. This model has been applied to both linear and nonlinear regimes for a range of experimental cases using measured profiles.

11781 (CONF-940933–27) **Dithering transitions in resistive pressure-gradient-driven turbulence.** Garcia, L. (Univ. Carlos III, Madrid (Spain)); Carreras, B.A.; Lynch, V.E.; Diamond, P.H. Oak Ridge National Lab., TN (United States); International Atomic Energy Agency, Vienna (Austria). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; FG03-88ER53275. (IAEA-CN–60/D-P-I-12). From 15. international conference on plasma physics and controlled nuclear fusion research; Seville (Spain); 26 Sep - 1 oct 1994. Order Number DE95006737. Source: OSTI; NTIS; INIS; GPO Dep.

A self-consistent model of the L to H transition has been derived from coupled nonlinear envelope equations for the fluctuation level, and radial electric field shear, E'_r. This model is based on general properties of the coupling between turbulence and averaged sheared flows. To extract these generic properties several turbulence models have been investigated. Here, some of the results obtained with the resistive pressure-gradient-driven turbulence are presented with special emphasis on the structure of the Reynolds stress and the existence of limit cycle solutions.

11782 (CONF-940933–29) **Nonlinear phenomena, turbulence and anomalous transport in fusion plasmas.** Hidalgo, C. (Asociancion Euratom-Ciemat, Madrid (Spain)); Estrada, T.; Sanchez, E.; Branas, B.; Garcia-Cortes, I.; Van Milligen, B.P.; Balbin, R.; Pedrosa, M.A.; Sanchez, J.; Carreras, B.A. Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 15. international conference on plasma physics and controlled nuclear fusion research; Seville (Spain); 26 Sep - 1 oct 1994. Order Number DE95007044. Source: OSTI; NTIS; INIS; GPO Dep.

The nonlinear nature of the plasma turbulence, as measured by bicoherence analysis, has been studied in stellarator (ATF and W7AS) and tokamak (PBXM) devices. In ATF, little nonlinear interaction is found in the scrape-off layer region whereas the strength of the coupling is enhanced in the edge plasma region where the level of fluctuations is consistent with the theoretical expectations from resistive interchange modes. In W7AS the level of bicoherence is significantly smaller than in ATF. The comparison ATF/W7AS/PBXM suggest the important role of the magnetic shear to determine nonlinear behavior of the turbulence. The level of bicoherence also depends on the plasma conditions: in particular, it increases at the H-mode transition. The comparison between the nonlinear behavior of the turbulence in tokamaks and stellarators allows experimental verification of theoretical turbulence models.

11783 (CONF-940933–30) **Dynamics of the L → H transition, VH-mode evolution, edge localized modes and R.F. driven confinement control in tokamaks.** Diamond, P.H. (Univ. of California, San Diego, La Jolla, CA (United States)); Lebedev, V.B.; Liang, Y.M.; Gruzinov, A.V.; Gruzinov, I.; Medvedev, M.; Carreras, B.A.; Newman, D.E.; Charlton, L.; Sidikman, K.L. Oak Ridge National Lab., TN (United States). [1995]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (IAEA-CN–60/D-2-II-6). From 15. international conference on plasma physics and controlled nuclear fusion research; Seville (Spain); 26 Sep - 1 oct 1994. Order Number DE95007012. Source: OSTI; NTIS; INIS; GPO Dep.

Several novel theoretical results related to L → H transition physics, VH-mode evolution, Edge Localized Modes and active confinement control are presented. Critical issues are identified, results are discussed and important unresolved questions are listed. The basic physics is discussed in the contexts of current experiments and of ITER.

11784 (CTH-IEFT-PP–1994-24) **Transport code simulations of ignition in the ITER EDA design.** Weiland, J. (Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics); Bateman, G. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. 1994. 6p. Order Number DE95620603. Source: OSTI; NTIS; INIS.

Predictive simulations have been performed for the ignition capability of ITER in the EDA design, using a toroidal drift wave model with one auxiliary ion species. The dynamics of trapped electrons, main ions and auxiliary ions with respective temperatures has been treated self-consistently including a full transport matrix. The code has been run in two modes. First the auxiliary ions are treated as impurities with the alpha power deposited directly on electrons. In this mode the results are similar to those previously obtained by the critical electron temperature gradient model but with the scaling of T_E with Z_{eff} dependent on the collision frequency. In the second mode the alpha power was given to the auxiliary ions which then became hot alphas. No significant degradation of the confinement occurred. 10 refs, 1 tab.

11785 (DOE/ER/54197–2) **Maryland Controlled Fusion Research Program. Progress report, November 1, 1993–October 31, 1994.** Antonsen, T.M. Jr.; Drake, J.F.; Finn, J.M.; Guzdar, P.N.; Hassam, A.; Liu, C.S.; Ott, E. Maryland Univ., College Park, MD (United States). Jul 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER54197. Order Number DE95006642. Source: OSTI; NTIS; INIS; GPO Dep.

The theoretical research activity at the University of Maryland supported by the Department of Energy focusses on two major tasks. They are: A. Transport, generation of shear flow and L-H transitions in Tokamaks; and B. MHD stability of Tokamaks. Titles of specific research projects under these fields carried out in this

period include: Poloidal rotation of tokamak plasmas at super-poloidal-sonic speeds; Rotation of plasmas in neoclassical regimes; New unstable branch of drift resistive ballooning modes in tokamaks; 3D fluid simulations of the drift resistive ballooning modes - twisted coordinate system; Disintegration of ion banana orbits in tokamak edge plamsas; Fast reconnection in high temperature plasmas; Dynamics of sawtooth collapse in tokamak plasmas; Effect of trapped particles on MHD modes; MHD stability of high beta toroidal equilibria.

11786 (DOE/ET/53088–682) **Nonlinear instability and chaos in plasma wave-wave interactions, I., Introduction.** Kueny, C.S.; Morrison, P.J. Texas Univ., Austin, TX (United States). Nov 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. Order Number DE95005529. Source: OSTI; INIS; NTIS; GPO Dep.

Conventional linear stability analyses may fail for fluid systems with an indefinite free energy functional. When such a system is linearly stable, it is said to possess negative energy modes. Instability may then occur either via dissipation of the negative energy modes, or nonlinearly via resonant wave-wave coupling, leading to explosive growth. In the dissipationless case, it is conjectured that intrinsic chaotic behavior may allow initially nonresonant systems to reach resonance by diffusion in phase space. In this and a companion paper [submitted to Physics of Plasmas], this phenomenon is demonstrated for a simple equilibrium involving cold counter-streaming ions. The system is described in the fluid approximation by a Hamiltonian functional and associated noncanonical Poisson bracket. By Fourier decomposition and appropriate coordinate transformations, the Hamiltonian for the perturbed energy is expressed in action-angle form. The normal modes correspond to Doppler-shifted ion-acoustic waves of positive and negative energy. Nonlinear coupling leads to decay instability via two-wave interactions, and to either decay or explosive instability via three-wave interactions. These instabilities are described for various (integrable) systems of waves interacting via single nonlinear terms. This discussion provides the foundation for the treatment of nonintegrable systems in the companion paper.

11787 (ENEA-RT-ERG-FUS–94-14) **Simple analysis of power load on the wall of IGNITOR Tokamak during normal operation.** Ferro, C. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute); Franzoni, G.; Zanino, R. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Apr 1994. 19p. (RT/ERG-FUS–94-14). Order Number DE95749716. Source: OSTI; NTIS (US Sales Only).

In this note it's analyzed with a very simple model the steady state heat flux distribution on structures which are nearly tangent to the magnetic field, including the contribution of energy flow across magnetic surfaces is analysed. The model is applied to the IGNITOR case.

11788 (ETDE-IT–95-02) **Quasilinear absorption of lower hybrid waves in tokamak plasmas.** Cardinali, A. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). ENEA, Frascati (Italy). Dipt. Fusione. 1994. 6p. (CONF-9408176–5: ISPP workshop on the theory of fusion plasmas, Varenna (Italy), 22-26 Aug 1994). Order Number DE95749683. Source: OSTI; NTIS (US Sales Only).

In a tokamak-like-reactor the most convenient way to generate plasma current is to use lower hybrid (LH) waves externally excited by means of slow-wave antennas. To study wave propagation and absorption in the LH frequency domain, a ray tracing code, which solves the equations for trajectories in the geometric optics approssimation, has been implemented and coupled to a code that solves the Fokker-Planck equation (FPE) with an added quasilinear diffusion term, for the electron distribution function F_e. The FPE is used in one dimension for obtaining an analytical distribution function, based on the assumption that the dependence of the electron distribution function on the perpendicular velocity is Maxwellian. The hypothesis has been verified by Karney and Fish, who numerically solved the FPE in two dimensions in the LH wave domain of frequencies showing that the 1-D theory accurately the current drive problem.

11789 (ETDE-IT–95-03) **Deuterium charging in palladium by electrolysis of heavy water: Measurement of lattice parameter.** Bertalot, L. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); De Marco, F.; Violante, V.; La Barbera, A.; De Ninno, A.; Scaramuzzi, F.; Felici, R. ENEA, Frascati (Italy). Dipt. Fusione. 1993. 5p. (CONF-9312104–: 4. international conference on cold fusion, Lahaina, HI (United States), 6-9 Dec 1993). Order Number DE95749688. Source: OSTI; NTIS (US Sales Only).

The X-ray diffraction measurements performed during the charging of a palladium cathode with deuterium by the electrolysis of a LiOD-heavy water solution to determine the lattice parameter have been reported. In this way it has been studies the dynamics and determined the D/Pd final ratio of the sample. Up to now have been studied three samples, which have shown very different behaviours. The estimated bulk deuterium concentration was then checked by degassing the cathode in a known volume.

11790 (ETDE-IT–95-05) **ICF target physics: (a) Rayleigh-Taylor instabilities; (b) heavy-ion driven targets.** Piriz, A.R. (INFN, Legnaro (Italy)); Wouchuk, J.G.; Temporal, M.; Atzeni, S.; Guerrieri, A.; Graziadei, S. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 8p. (CONF-940933–31: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95749699. Source: OSTI; NTIS (US Sales Only).

Rayleigh-Taylor instabilities (RTI) have been studied under conditions relevant to inertial confinement fusion (ICF). An analytical expression has been derived for the linear growth rate of ablative RTI, taking into account the specific transport mechanism in the unstable layer. Agreement with the so-called Takabe formula, and with preliminary 2-D numerical simulations ids found. The evaluation of a large spectrum of modes of the ideal RTI has been studied by 2-D simulations. Conditions for the onset of turbolent mixing have been derived. Studies on indirect-drive heavy-ion fusion targets are also reported. Gain curves for hohlraum targets have been generated analytically. Progress in the study of spherical targets with a diffuse converter is discussed.

11791 (ETDE-IT–95-09) **Global particle balance and local particle transport in Frascati Tokamak Upgrade.** Alladio, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Apicella, M.L.; Apruzzese, G.; Bartiromo, R.; Bracco, G.; Buceti, G.; Buratti, P.; Centioli, C.; Ciotti, M.; Borra, M. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 13p. (CONF-940933–32: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95749705. Source: OSTI; NTIS (US Sales Only).

An investigation of global and local particle confinement properties for gas fuelled discharges in the Frascati Tokamak Upgrade is presented.

11792 (ETDE-IT–95-10) **Calibration of the neutron profile monitor diagnostic at JET by means of the Monte Carlo code for Neutron and Photon transport MCNP.** Rapisarda, M. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). ENEA, Frascati (Italy). Dipt. Fusione. 1994. 5p. (CONF-9406176–6: 4. international conference on applications of nuclear techniques: neutrons and their applications, Crete (Greece), 12-18 Jun 1994). Order Number DE95006002. Source: OSTI; NTIS (US Sales Only).

The neutron profile monitor diagnostic at JET consists of two neutron cameras viewing 19 different chords of the plasma through 10 horizontal and 9 vertical collimator, a detector system using liquid scintillators records the neutrons coming from the subtended solid angle. To obtain absolute measurements of the plasma neutron emission, the system has to be calibrated taking into account the neutron transport in the materials constituting the profile monitors. The Monte Carlo code MCNP has been employed to simulate the transport through the cameras, to calculate the corrections to the simple optical model, due to transmission, cross talk, scattering and absorption of neutrons. The result of the simulation has led to correction factors that, depending on the position and the width of the channel considered and on the neutron source energy, can be as large as 20% in a diagnostic which is now calibrated to a few percent.

11793 (ETDE-IT–95-11) **Alpha-particle induced collective effects in reactor-relevant plasmas.** Romanelli, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Zonca, F. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 14p. (CONF-9408189–3: ISPP workshop on tokamak concept improvement, Varenna (Italy), 29 Aug - 3 sep 1994). Order Number DE95749711. Source: OSTI; NTIS (US Sales Only).

The present work is an overview of the most important instabilities in reactor-relevant plasmas, associated with the presence of energetic particles such as fusion products or high-energy ions due to auxiliary heating and/or neutral beam injecton. Instabilities are conveniently classified according to the frequency range in which the resonant interaction occurs. At the trapped particles precessional frequency, the dynamics of the fishbone mode is discussed. At higher frequencies, comparable with that of the transit or bounce motion of energetic particles, the stability of Alfvn gap modes is analyzed. In relation to the relevance of energetic particles driven instabilities for reactor operations, the issue of energetic particles losses is discussed. In particular, it is emphasized that the most dangerous class of instabilities is that whose frequency locks to the particles characteristic frequency, as, e.g., for the 'fishbone' mode.

11794 (ETDE-IT–95-12) **Energy confinement in FTU ohmic plasma.** Alladio, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Apicella, M.L.; Apruzzese, G.; Bartiromo, R.; Bombarda, F.; Bracco, G.; Buceti, G.; Buratti, P.; Centioli, C.; Borra, M. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 26p. (CONF-940933–33: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95749712. Source: OSTI; NTIS (US Sales Only).

This paper presents energy confinement data for FTU deuterium plasma in ohmic regime, discussing in detail the role of the ion transport and the scaling of confinement with the toroidal magnetic field. New experimental data on ion temperature are presented and their analysis shows that, taking into account the experimental error bars, a role of the ion transport in the saturated energy confinement can not be excluded, even with an ion thermal diffusivity less or equal to 3 times the neoclassical value. The magnetic filed dependence of the energy confinement is shown to be weak, from the analysis of experimental results at 2.5, 4.6 and 7 T. The scalings of the relevant plasma quantities with the magnetic field are also presented.

11795 (GA-A–21903) **Effect of toroidal plasma flow and flow shear on global MHD modes.** Chu, M.S. (General Atomics, San Diego, CA (United States)); Greene, J.M.; Jensen, T.H.; Miller, R.L.; Bondeson, A.; Johnson, R.W.; Mauel, M.E. General Atomics, San Diego, CA (United States). Jan 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-941101–3: Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95006676. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of a subsonic toroidal flow on the linear magnetohydrodynamic stability of a tokamak plasma surrounded by an external resistive wall is studied. A complex non-self-adjoint eigenvalue problem for the stability of general kink and tearing modes is formulated, solved numerically, and applied to high β tokamaks. Results indicate that toroidal plasma flow, in conjunction with dissipation in the plasma, can open a window of stability for the position of the external wall. In this window, stable plasma beta values can significantly exceed those predicted by the Troyon scaling law with no wall. Computations utilizing experimental data indicate good agreement with observations.

11796 (GSI–94-10) **High energy density in matter produced by heavy ion beams. Annual report 1993.** Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jun 1994. 95p. Order Number DE95746565. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental activities at GSI were concentrated on the progress in beam-plasma interaction experiments of heavy ion with ionized matter, plasma - lens forming devices, intense beam at high temperature experimental area, and charge change collisions of ions. The development to higher intensities and phase space densities during 1993 for the SIS and the ESR is recorded. The possibility of studying of funneling of two beams in a two-beam RFQ is studied. Specific results are presented with respect to inertial confinement fusion (ICF). The problem of ion stopping in plasma and pumping X-ray lasers with heavy ion beams are discussed. Various contributions deal with dense plasma effects, shocks and opacity. (HP)

11797 (IPP–1/280) **Pellet injector for diagnostics purposes.** Lang, P.T. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany)); Cierpka, P.; Egorov, S.M.; Kass, T.; Kuteev, B.V.; Reznichenko, P.V. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jul 1994. 22p. Order Number DE95746388. Source: OSTI; NTIS (US Sales Only); INIS.

We report the design, construction and the testbed results for a novel compact gas gun injector for solid diagnostic pellets of different sizes and materials. The injector was optimized for the diagnostic requirements of the ASDEX Upgrade tokamak, yielding the possibility of a widely varying deposition profile of ablated material inside the plasma. This allows variation of the pellet velocity and the total number of injected atoms. The use of different propellant gases (He, N_2, H_2) results in an accessible velocity range from about 150 m/s to more than 600 m/s in the case of spherical carbon pellets with masses ranging from $2x10^{18}$ to 10^{20} atoms. Both the scattering angle ($\propto 1$) and the maximum propellant gas throughput to the tokamak (less than 10^{16} gas particles) were found to be sufficiently low. The injector provided both high efficiency ($\geq$85%) and high reliability during the whole testbed operation period and also during the first injection experiments performed on ASDEX Upgrade. The pellet velocities achieved for different propellant gas pressures, pellet diameters, and pellet materials were analyzed. We found that, although the pellet diameters range from 0.45 to 0.85 times the barrel diameter, the pellet acceleration is mostly caused by gas drag. Pellet velocities in excss of those calculated on the basis of the gas drag model were observed. Additional acceleration that increases with the pellet diameter contrary to the gas drag model may be explained by the influence of the pellet on the gas dynamics in the barrel. (orig.)

11798 (IPP–5/60) **Sensitivity study of a proposed polarimetry diagnostic on ASDEX upgrade.** Callaghan, H.P. (University Coll., Cork (Ireland). Dept. of Physics); McCarthy, P.J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Sep 1994. 31p. Order Number DE95746387. Source: OSTI; NTIS (US Sales Only); INIS.

ASDEX-Upgrade currently uses FIR interferometry (DCN, 195 μm) as a technique for measuring line integrated electron density along eight chords of the plasma cross-section. A polarimetry diagnostic based on Faraday rotation using the existing setup would yield $\int n_e B.dl$ along the same chords which, in combination with the $\int n_e dl$ measurements, would provide additional information about the poloidal magnetic field. This would be helpful for reconstructing the $q(\psi)$ profile, which is difficult to recover from external magnetic measurements alone. A sensitivity study to determine the effectiveness of adding polarimetry to ASDEX Upgrade is carried out using function parameterization on a simulated equilibrium database, together with a database of randomly chosen density profiles with four degrees of freedom. The robustness of the recovery in the presence of measurement noise and the effects of plasma birefringence are taken into account. (orig.)

11799 (IPP–6/323) **Nonexistence of MHD equilibria with poloidally closed field lines in the case of violated axisymmetry.** Salat, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Oct 1994. 39p. Order Number DE95753817. Source: OSTI; NTIS (US Sales Only); INIS.

The existence of nonaxisymmetric toroidal magnetohydrodynamic (MHD) equilibria whose magnetic field lines are closed after one poloidal turn around the magnetic axis C is investigated analytically. Up-down symmetry of the configuration with respect to the equatorial plane which contains the axis is assumed. In principle, nonaxisymmetry is manifested in the form of a noncircular axis or a variation of the geometry and/or magnetic field along a circular axis. It is proved that no equilibrium with a noncircular axis exists. For a circular axis, nonexistence is proved if the ellipticity of the cross section varies along C. Nor is variation of the triangularity, etc., up

to the seventh Fourier mode with respect to the poloidal angle, allowed. For variations with still higher mode numbers nonexistence is made plausible. For the magnetic field the situation is analogous. Nonaxisymmetric poloidal equilibria with equatorial mirror symmetry are thus practically rule out. The method of investigation is an expansion in the distance from the magnetic axis, supported by the algebraic computer language REDUCE. With growing order the number of constraints on the configuration increases until the quoted results are obtained in sixth and higher orders. (orig.)

11800 (IPP–6/324) **Exact three-dimensional MHD equilibria without continuous symmetries.** Salat, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Nov 1994. 9p. Order Number DE95751955. Source: OSTI; NTIS (US Sales Only); INIS.

Exact three-dimensional solutions of the magnetohydrodynamic (MHD) equations are presented. The configurations are infinitely extended along a straight axis and have neither cylindrical nor helical symmetry. All field lines are plane and closed around the axis. The magnetic surfaces have elliptical cross-sections whose ellipticity along the axis is an arbitrary function. (orig.)

11801 (IPP–9/103) **The low energy neutral particle analyzer (LENA) at W7-AS.** Verbeek, H.; Schiavi, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Oct 1994. 41p. Order Number DE95751956. Source: OSTI; NTIS (US Sales Only); INIS.

A detailed documentation of the experimental arrangement of the Low Energy Neutral particle Analyzer (LENA) at W7-AS is given. The diagnostic was routinely measuring CX-fluxes and energy distributions during the period from 1992 to 94. Some typical results are reported and a phenomenological discussion of the reaction of the CX-fluxes and spectra to the variation of various plasma parameters is presented. The comparison with H_α-signals indicate whether variations of the CX-fluxes are due to changes of the wall recycling or due to alterations of the plasma profiles. T_i profiles near the edge can be determined from the LENA-spectra when the neutral atom density is simulated by the EIRENE code. For the latter to the thesis of Heinrich (1994) is referred. (orig.)

11802 (IPPCZ–337) **Test of the quasi-optical grill for lower hybrid current drive on the CASTOR tokamak.** Klima, R. (Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu); Pavlo, P.; Preinhaelter, J.; Stoeckel, J.; Zacek, F.; Jakubka, K.; Kletecka, P.; Kryska, L. Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu. Mar 1994. 21p. Order Number DE95619534. Source: OSTI; NTIS (US Sales Only); INIS.

Feasibility studies of a new diffraction structure for launching lower hybrid waves into a tokamak plasma - of the microwave quasi-optical grill - are reported. The main parameters of the grill designed for the CASTOR tokamak are summarized, and results of preliminary radiation pattern measurements of a non-optimized model antenna are presented. The influence of a relatively great curvature of the plasma surface in the CASTOR tokamak is discussed and the ray tracing of the launched lower-hybrid wave in the actual CASTOR plasma is shown. Finally, the results of probe measurements of the CASTOR plasma core are given. (J.U.) 17 figs., 9 refs.

11803 (IPPCZ–338) **The reflection of relativistic electron beam by virtual cathode.** Vrba, P. (Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu). Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu. May 1994. 16p. Order Number DE95619511. Source: OSTI; NTIS (US Sales Only); INIS.

The formation in the REBEX experimental device of a Virtual Cathode (VC) by a Relativistic Electron Beam (REB) propagating through the end foil into the vacuum region was studied. The properties of the beam (homogeneity and angular spread of particle velocities) and of the originating magnetic fields (e.g. equipotentials of the VC, the internal azimuthal magnetic field) were determined numerically using the 2d relativistic electromagnetic current-line code 'POISSON 2'. The dependence was calculated of the reflection coefficient of the REB scattered by the formed VC, on the total beam current, beam energy, external magnetic field and on the length of vacuum drift tube. The results obtained are useful for an additional plasma heating mechanism via the two-stream instability generated by the oscillating REB. (author) 1 tab., 15 figs., 7 refs.

11804 (IPPCZ–339) **Velocity spread of REB generated by high current diode.** Vrba, P. (Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu). Ceska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu. May 1994. 15p. Order Number DE95619512. Source: OSTI; NTIS (US Sales Only); INIS.

A theoretical analysis and numerical simulations of the Relativistic Electron Beam (REB) generation in a high current diode immersed in an external magnetic field were performed. The calculations confirmed the generated beam to be homogeneous and monoenergetic in a broad central region. In the case of a cylindrical diode the mixing of electron trajectories was only observed in a narrow peripheral beam region. The angle between particle trajectories and the external longitudinal magnetic field varies chaotically form 0 to -25 deg. This phenomenon suppresses the excitation of the two-stream instability excited by REB in a plasma column. (author) 2 tabs., 12 figs., 7 refs.

11805 (JAERI-Research–94-033) **Analysis of high energy ion ripple loss in the up-down asymmetric configuration by OFMC plus mapping hybrid code.** Konovalov, S. (Gosudarstrennyj Komitet po Ispol'zovaniyu Atomnoj Ehergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Takizuka, Tomonori; Tani, Keiji; Hamamatsu, Kiyotaka; Azumi, Masafumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 30p. Order Number DE95747885. Source: OSTI; NTIS; INIS.

New version of a Mapping code for the up-down asymmetric configuration is developed. Combination of Mapping with OFMC, a Hybrid code, provides an effective tool for reliable and fast calculations of high energy ion ripple losses in a tokamak including both total loss fraction and lost power distribution over the first wall. Results of the analysis by this Hybrid code on the NBI ion ripple losses in JT-60U are in a good agreement with experimental and previous OFMC data. (author).

11806 (JAERI-Research–94-036) **Direct measurement of MeV-range atomic hydrogen using a charge-exchange neutral particle analyzer in ICRF-heated JT-60U plasmas.** Kusama, Yoshinori (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Afanassiev, V.I.; Petrov, S.Y. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 16p. Order Number DE95747884. Source: OSTI; NTIS; INIS.

The energetic atomic hydrogen in an MeV range produced by the ion cyclotron range of frequency heating in JT-60U plasma was directly measured with a charge-exchange neutral particle analyzer. Particle signals from the detector were successfully separated from the neutron and γ ray background by the pulse height analysis (PHA) method used first in all detector channels. The net flux of atomic hydrogen was easily obtained by summing counted numbers of PHA channels over the peak formed by atomic hydrogen. (author).

11807 (JAERI-Tech–94-018) **The plasma position control of ITER EDA plasma.** Senda, Ikuo (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Nishio, Satoshi; Tsunematsu, Toshihide; Nishino, Toru; Fujieda, Hirobumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1994. 62p. Order Number DE95747845. Source: OSTI; NTIS; INIS.

The study on the plasma position control of ITER EDA performed by Japan Home Team during the sensitivity study in 1994 is summarized. The controllabilities of plasmas in the Outline Design and elongated version are compared. The model used to describe the motion of the plasma is a rigid model. The PD feedback control is applied with respect to the displacements of the plasma from the equilibrium. Three types of fluctuations, which initiate the motion of the plasma, are examined, namely a finite horizontal fluctuation field, a small horizontal fluctuation field such that the motion of the plasma is governed by the passive structures and an abrupt change of the poloidal beta β_p and internal inductance l_i. In the simulations of finite horizontal fluctuation fields, controls depend on the strength of the fluctuations, for instance, 3-5V is needed for 5-10G of fluctuation fields in the Outline Design. When the fluctuation field is small and the plasma displacement grows in a characteristic time of the passive structures, a few volt of the control voltage is enough to obtain good controllability. It is

shown that the control when (β_p, l_i) changes simultaneously is demanding and a large control voltage is required to maintain satisfactory control. Comparing the elongated version with the Outline Design, the control voltage which is larger than the Outline Design by a factor of 2-3 is required to obtain the same controllability in the elongated version. (author).

11808 (LA-UR–95-100) **Bubble fusion: Preliminary estimates.** Krakowski, R.A. Los Alamos National Lab., NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006337. Source: OSTI; NTIS; INIS; GPO Dep.

The collapse of a gas-filled bubble in disequilibrium (i.e., internal pressure $\ll$ external pressure) can occur with a significant focusing of energy onto the entrapped gas in the form of pressure-volume work and/or acoustical shocks; the resulting heating can be sufficient to cause ionization and the emission of atomic radiations. The suggestion that extreme conditions necessary for thermonuclear fusion to occur may be possible has been examined parametrically in terms of the ratio of initial bubble pressure relative to that required for equilibrium. In this sense, the disequilibrium bubble is viewed as a three-dimensional "sling shot" that is "loaded" to an extent allowed by the maximum level of disequilibrium that can stably be achieved. Values of this disequilibrium ratio in the range 10^{-5}–10^{-6} are predicted by an idealized bubble-dynamics model as necessary to achieve conditions where nuclear fusion of deuterium-tritium might be observed. Harmonic and aharmonic pressurizations/decompressions are examined as means to achieve the required levels of disequilibrium required to create fusion conditions. A number of phenomena not included in the analysis reported herein could enhance or reduce the small levels of nuclear fusions predicted.

11809 (NIFS–288) **Self-sustained magnetic braiding in toroidal plasmas.** Itoh, K.; Fukuyama, A.; Itoh, S.; Yagi, M.; Azumi, M. National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 19p. Order Number DE95747843. Source: OSTI; NTIS; INIS.

Theory for the magnetic braiding in toroidal plasmas, which is caused by microscopic pressure-gradient-driven turbulence, is developed. When the pressure gradient exceeds a threshold, the self-sustaining of the magnetic braiding and enhanced anomalous transport occur. The balance between the nonlinear destabilization and nonlinear stabilization, which determines the stationary turbulence, is solved analytically for the case of interchange mode. The enhanced thermal conductivity and magnetic perturbation amplitude as well as the threshold pressure gradient are obtained. Cusp-type catastrophe is predicted, allowing the abrupt burst of magnetic perturbations. (author).

11810 (NIFS–289) **Relativistic effects on large amplitude nonlinear Langmuir waves in a two-fluid plasma.** Nejoh, Yasunori (Hachinohe Inst. of Tech., Aomori (Japan)). National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 28p. Order Number DE95747842. Source: OSTI; NTIS; INIS.

Large amplitude relativistic nonlinear Langmuir waves are analyzed by the pseudo-potential method. The existence conditions for nonlinear Langmuir waves are confirmed by considering relativistic high-speed electrons in a two-fluid plasma. The significant feature of this investigation is that the propagation of nonlinear Langmuir waves depends on the ratio of the electron streaming velocity to the velocity of light, the normalized potential and the ion mass to electron mass ratio. The constant energy is determined by the specific range of the relativistic effect. In the non-relativistic limit, large amplitude relativistic Langmuir waves do not exist. The present investigation predicts new findings of large amplitude nonlinear Langmuir waves in space plasma phenomena in which relativistic electrons are important. (author).

11811 (NIFS–291) **Formation of positive radial electric field by electron cyclotron heating in compact helical system.** Idei, H. (and others); Ida, K.; Sanuki, H. National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 40p. Order Number DE95747840. Source: OSTI; NTIS; INIS.

The radial electric field is driven to positive value by off-axis second harmonic electron cyclotron heating (ECH) in the Compact Helical System. The observed positive electric field is associated with the outward particle flux enhanced with ECH. The enhanced particle flux triggered by the production of the electrons accelerated perpendicularly to the magnetic field with ECH results in the change of the electric field. (author).

11812 (NIFS–293) **Effects of impurities released from high Z test limiter on plasma performance in TEXTOR.** Ueda, Y. (Osaka Univ., Suita (Japan). Faculty of Engineering); Tanabe, T.; Philipps, V. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 22p. Order Number DE95747838. Source: OSTI; NTIS; INIS.

To investigate the feasibility of high Z metals as plasma facing materials, a Mo test limiter was inserted into the TEXTOR edge plasma and the Mo content in the core plasma and its flux from the limiter have been observed. In OH plasma the additional radiation due to Mo impurities increased with line averaged density n_e-bar. Beyond n_e-bar of about 3×10^{19} m^{-3}, the central radiation increased strongly with time and a hollow temperature profile appeared. In contrast, Mo impurity radiation decreased with n_e-bar in NBI (co-injection) plasma and no clear Mo accumulation in the plasma center was observed. However, when the edge plasma was cooled by neon injection in NBI plasma, the Mo concentration in the plasma center substantially increased. The Mo flux from the limiter showed no remarkable change during the OH and NBI density scan or with neon cooling. The possible reasons for the Mo behavior in the core plasma are discussed. (author).

11813 (NIFS–295) **Magnetic mirror effect as a trigger of collisionless magnetic reconnection.** Bazdenkov, S.; Sato, Tetsuya; Horiuchi, Ritoku; Watanabe, Kunihiko. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 17p. Order Number DE95747836. Source: OSTI; NTIS; INIS.

A new mechanism of collisionless magnetic reconnection is proposed. It is based on the current density redistribution along the magnetic field lines caused by the reflection of meandering particles due to the magnetic mirror effect from the would-be reconnection region. (author).

11814 (NIFS–296) **Anomalous transport theory for toroidal helical plasmas.** Itoh, K.; Yagi, M.; Itoh, S.; Fukuyama, A.; Sanuki, H.; Azumi, M. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 16p. Order Number DE95747832. Source: OSTI; NTIS; INIS.

Anomalous transport coefficients in toroidal helical plasmas are studied, based on the innovative theoretical method. The self-sustained turbulence is analyzed by balancing the nonlinear growth due to the current diffusivity with the nonlinear damping by the ion viscosity and thermal conductivity. Interchange and ballooning mode turbulence is investigated, and the geometrical dependence of the anomalous transport coefficient is clarified. Variation of transport owing to the geometrical difference in toroidal helical plasmas is illustrated. The mechanism for confinement improvement is searched for. To verify the nonlinear destabilization and the self-sustained state, the nonlinear simulation of the interchange mode turbulence is performed in a sheared slab. It is demonstrated that the nonlinear enhancement of the growth rate occurs when the fluctuation amplitude exceeds the critical level. In the saturation stage, the fluctuation level becomes higher associated with the enhanced nonlinear growth. (author).

11815 (NIFS–299) **Impact of rotational-transform profile control on plasma confinement and stability in CHS.** Toi, K. (and others); Morisaki, T.; Sakakibara, S. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 16p. Order Number DE95747833. Source: OSTI; NTIS; INIS.

In neutral beam heated plasmas of CHS, which is a low aspect-ration heliotron/torsatron device, the effect of rotational transform (ι) profile shape on plasma confinement and stability is studied by inducing a net plasma current (Ip). In the case that the external ι is increased by Ip, very rapid H-mode transition (within $\approx$0.2 ms) is observed at the thresholds of Ip and heating power, having all characteristics found in the tokamak H-mode. There is no obvious difference in the H-mode characteristics between deuterium and hydrogen plasmas. In the opposite case that the external ι is decreased by reversing Ip, the H-mode transition is not observed. (author).

11816 (ORNL/TM–12923) **One dimensional global and local solution for ICRF heating.** Wang, C.Y.; Batchelor, D.B.; Jaeger, E.F.; Carter, M.D. Oak Ridge National Lab., TN (United States). Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95007984. Source: OSTI; NTIS; INIS; GPO Dep.

A numerical code GLOSI [Global and Local One-dimensional Solution for Ion cyclotron range of frequencies (ICRF) heating] is developed to solve one-dimensional wave equations resulting from the use of radio frequency (RF) waves to heat plasmas. The code uses a finite difference method. Due to its numerical stability, the code can be used to find both global and local solutions when imposed with appropriate boundary conditions. Three types of boundary conditions are introduced to describe wave scattering, antenna wave excitation, and fixed tangential wave magnetic field. The scattering boundary conditions are especially useful for local solutions. The antenna wave excitation boundary conditions can be used to excite fast and slow waves in a plasma. The tangential magnetic field boundary conditions are used to calculate impedance matrices, which describe plasma and antenna coupling and can be used by an antenna code to calculate antenna loading. These three types of boundary conditions can also be combined to describe various physical situations in RF plasma heating. The code also includes plasma thermal effects and calculates collisionless power absorption and kinetic energy flux. The plasma current density is approximated by a second-order Larmor radius expansion, which results in a sixth-order ordinary differential equation.

11817 (PPPL–3001) **Isotopic scaling of transport in deuterium-tritium plasmas.** Scott, S.D. (Princeton Univ., NJ (United States). Plasma Physics Labs.); Adler, H.; Bell, M.G.; Bell, R.; Budny, R.V.; Ernst, D.R.; Bush, C.E.; Chang, Z.; Duong, H. Princeton Univ., NJ (United States). Plasma Physics Lab. Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-940003–1: Workshop in fusion plasmas, Goeteborg (Sweden), 1994). Order Number DE95006237. Source: OSTI; NTIS; INIS; GPO Dep.

Both global and thermal energy confinement improve in high-temperature supershot plasmas in the Tokamak Fusion Test Reactor (TFTR) when deuterium beam heating is partially or wholly replaced by tritium beam heating. For the same heating power, the tritium-rich plasmas obtain up to 22% higher total energy, 30% higher thermal ion energy, and 20-25% higher central ion temperature. Kinetic analysis of the temperature and density profiles indicates a favorable isotopic scaling of ion heat transport and electron particle transport, with $\tau_{Ei}(a/2) \propto (A)^{0.7-0.8}$ and $\tau_{pe}(a) \propto (A)^{0.8}$.

11818 (PPPL–3012) **Review of recent experiments on magnetic reconnection in laboratory plasmas.** Yamada, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007358. Source: OSTI; NTIS; INIS; GPO Dep.

The present paper reviews recent laboratory experiments on magnetic reconnection. Examples will be drawn from electron current sheet experiments, merging spheromaks, and from high temperature tokamak plasmas with the Lundquist numbers exceeding 10^7. These recent laboratory experiments create an environment which satisfies the criteria for MHD plasma and in which the global boundary conditions can be controlled externally. Experiments with fully three dimensional reconnection are now possible. In the most recent TFTR tokamak discharges, Motional Stark effect (MSE) data have verified the existence of a partial reconnection. In the experiment of spheromak merging, a new plasma acceleration parallel to the neutral line has been indicated. Together with the relationship of these observations to the analysis of magnetic reconnection in space and in solar flares, important physics issues such as global boundary conditions, local plasma parameters, merging angle of the field lines, and the 3-D aspects of the reconnection are discussed.

11819 (PPPL–3035) **Hamiltonian approach to the magnetostatic equilibrium problem.** Tessarotto, M. (Universita di Trieste (Italy)); Zheng, Lin Jin; Johnson, J.L. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007356. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to investigate the classical scalar-pressure magnetostatic equilibrium problem for non-symmetric configurations in the framework of a Hamiltonian approach. Requiring that the equilibrium admits locally, in a suitable subdomain, a family of nested toroidal magnetic surfaces, the Hamiltonian equations describing the magnetic flux lines in such a subdomain are obtained for general curvilinear coordinate systems. The properties of such Hamiltonian system are investigated. A representation of the magnetic field in terms of arbitrary general curvilinear coordinates is thus obtained. Its basic feature is that the magnetic field must fulfill suitable periodicity constraints to be imposed on arbitrary rational magnetic surfaces for general non-symmetric toroidal equilibria, i.e., it is quasi-symmetric. Implications for the existence of magnetostatic equilibria are pointed out. In particular, it is proven that a generalized equilibrium equation exists for such quasi-symmetric equilibria, which extends the Grad-Shafranov equation to fully three-dimensional configurations. As an application, the case is considered of quasi-helical equilibria, i.e., displaying a magnetic field magnitude depending on the poloidal (χ) and toroidal (ϑ) angles only in terms of $\alpha=\chi-N\theta$ with N an arbitrary integer.

11820 (PPPL–3037) **Review of recent D-T experiments from TFTR.** Hawryluk, R.J. (and others); Adler, H.; Alling, P.; Ancher, C.; Anderson, H.; Anderson, J.W.; Arunasalam, V.; Ascione, G.; Ashcroft, D.; Barnes, G.; Bateman, G. Princeton Univ., NJ (United States). Plasma Physics Lab.; Los Alamos Scientific Lab., NM (United States). Jan 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073 ; W-7405-ENG-36. (IAEA-CN–60/A-1-I-1; LA-UR–94-3665; CONF-940933–14: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95006227. Source: OSTI; NTIS; INIS; GPO Dep.

An extensive set of deuterium-tritium (D-T) experiments has been carried out on the Tokamak Fusion Test Reactor (TFTR), using nearly equal concentrations of deuterium and tritium. The fusion power has been increased to 9.3 MW, using 34 MW of neutral-beam heating, in a supershot discharge and to 6.7 MW in a high-pp discharge following a current rampdown. Extensive lithium pellet injection has increased the confinement time to 0.27 s and enabled higher current operation in both supershot and high-pp discharges. The energy confinement time, τ_E, was observed to increase in D-T, relative to D plasmas, by 20% and the $n_i(0)Ti(0)\tau_E$ product by 55%. The improvement in thermal confinement was caused primarily by a decrease in ion heat conductivity in both supershot and limiter-H-mode discharges. ICRF heating of a D-T plasma, using the second harmonic of tritium, has been demonstrated. First measurements of the confined alpha particles have been performed and found to be in good agreement with TRANSP simulations. Initial measurements of the alpha ash profile have been compared with simulations using particle transport coefficients from He gas puffing experiments. The loss of alpha particles to a detector at the bottom of the vessel is well described by the first-orbit loss mechanism. No loss due to alpha-particle-driven instabilities has yet been observed. The TFIR experiments were able to challenge and confirm several of the underlying assumptions of the ITER design.

11821 (PPPL–3041) **Quasilinear analysis of absorption of ion Bernstein waves by electrons.** Cardinali, A. (Associazione Euratom-ENEA sulla Fusione, Rome (Italy)); Paoletti, F.; Bernabei, S.; Ono, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Jan 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007357. Source: OSTI; NTIS; INIS; GPO Dep.

The effects induced on plasma electrons by an externally launched ion Bernstein wave (IBW), in the presence of a lower hybrid wave (LHW) in the current drive regime, are studied by analytical integration of the IBW ray-tracing equations along with the amplitude transport equation (Poynting theorem). The electric field amplitude parallel and perpendicular to the external magnetic field,

the quasilinear diffusion coefficient, and the modified electron distribution function are analytically calculated in the case of IBW. The analytical calculation is compared to the numerical solution obtained by using a 2-D Fokker-Planck code for the distribution function, without any approximation for the collision operator. The synergy between the IBW and LHW can be accounted for, and the absorption of the IBW power when the electron distribution function presents a tail generated by the LHW in the current drive regime can be calculated.

11822 (PPPL–3047) **Optimization of nonthermal fusion power consistent with energy channeling.** Snyder, P.B.; Herrmann, M.C.; Fisch, N.J. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007360. Source: OSTI; NTIS; INIS; GPO Dep.

If the energy of charged fusion products can be diverted directly to fuel ions, non-Maxwellian fuel ion distributions and temperature differences between species will result. To determine the importance of these nonthermal effects, the fusion power density is optimized at constant-β for nonthermal distributions that are self-consistently maintained by channeling of energy from charged fusion products. For D-T and D-^{3}He reactors, with 75% of charged fusion product power diverted to fuel ions, temperature differences between electrons and ions increase the reactivity by 40-70%, while non- Maxwellian fuel ion distributions and temperature differences between ionic species increase the reactivity by an additional 3-15%.

11823 (PPPL–3048) **ICRF heating and transport of deuterium-tritium plasmas in TFTR.** Rogers, J.H. (Princeton Plasma Physics Lab., NJ (United States)); Schilling, G.; Stevens, J.E.; Taylor, G.; Wilson, J.R.; Bell, M.G.; Budny, R.V.; Bretz, N.L.; Darrow, D.; Fredrickson, E. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007362. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes results of the first experiments utilizing high-power ion cyclotron range of frequency (ICRF) to heat deuterium-tritium (D-T) plasmas in reactor-relevant regimes on the Tokamak Fusion Test Reactor (TFTR). Results from these experiments have demonstrated efficient core, second harmonic, tritium beating of D-T supershot plasmas with tritium concentrations ranging from 6%-40%. Significant direct ion heating on the order of 60% of the input radio frequency (rf) power has been observed. The measured deposition profiles are in good agreement with two-dimensional modeling code predictions. Energy confinement in an rf-heated supershot is at least similar to that without rf, and possibly better in the electron channel. Efficient electron heating via mode conversion of fast waves to ion Bernstein waves (IBW) has been demonstrated in ohmic, deuterium-deuterium and DT-neutral beam injection plasmas with high concentrations of minority ^{3}He (n_{3He}/n_e = 15% - 30%). By changing the ^{3}He concentration or the toroidal field strength, the location of the mode-conversion radius was varied. The power deposition profile measured with rf power modulation indicated that up to 70% of the power can be deposited on electrons at an off-axis position. Preliminary results with up to 4 MW coupled into the plasma by 90-degree phased antennas showed directional propagation of the mode-converted IBW. Analysis of heat wave propagation showed no strong inward thermal pinch in off-axis heating of an ohmically-heated target plasma in TFTR.

11824 (PPPL–3049) **Existence of core localized toroidicity-induced Alfven eigenmode.** Fu, G.Y. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007361. Source: OSTI; NTIS; INIS; GPO Dep.

The core-localized toroidicity-induced Alfven eigenmode (TAE) is shown to exist at finite plasma pressure due to finite aspect ratio effects in tokamak plasma. The new critical beta for the existence of the TAE mode is given by $\alpha \approx 3\epsilon + 2s^2$, where $\epsilon = r/R$ is the inverse aspect ratio, s is the magnetic shear and $\alpha = -Rq^2 d\beta/dr$ is the normalized pressure gradient. In contrast, previous critical α is given by $\alpha \approx s^2$. In the limit of $s << \sqrt{r/R}$, the new critical α is greatly enhanced by the finite aspect ratio effects.

11825 (PPPL–3050) **Gyrokinetic particle simulation of neoclassical transport.** Lin, Z.; Tang, W.M.; Lee, W.W. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007359. Source: OSTI; NTIS; INIS; GPO Dep.

A time varying weighting (δ f) scheme for gyrokinetic particle simulation is applied to a steady state, multi-species simulation of neoclassical transport. Accurate collision operators conserving momentum and energy are developed and implemented. Simulation results using these operators are found to agree very well with neoclassical theory. For example, it is dynamically demonstrated in these multispecies simulations that like-particle collisions produce no particle flux and that the neoclassical fluxes are ambipolar for an ion-electron plasma. An important physics feature of the present scheme is the introduction of toroidal sheared flow to the simulations. Simulation results are in agreement with the existing analytical neoclassical theory of Hinton and Wong. The poloidal electric field associated with toroidal mass flow is found to enhance density gradient driven electron particle flux and the bootstrap current while reducing temperature gradient driven flux and current. Finally, neoclassical theory in steep gradient profile relevant to the edge regime is examined by taking into account finite banana width effects. In general, the present work demonstrates a valuable new capability for studying important aspects of neoclassical transport inaccessible by conventional analytical calculation processes.

11826 (PPPL-CFP–3188) **Exploration of low-aspect-ratio tokamak regimes in CDX-U.** Hwang, Y.S. (and others); Jones, T.G.; Ono, M. Princeton Univ., NJ (United States). Plasma Physics Lab. [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9409281–1: IAEA technical meeting on research using small tokamaks, Madrid (Spain), 22-23 Sep 1994). Order Number DE95005536. Source: OSTI; NTIS; INIS; GPO Dep.

In the low-aspect-ratio tokamak regime, a lower q(a) regime (i.e. $q(a) \leq 5$, $A = R/a \approx 1.5$) has been explored in CDX-U. Using a relatively low toroidal magnetic field, plasma discharges with $I_p \leq 53$ kA, and $q(a) \geq 4$ [qcyl(a) ≥ 1] have been obtained. Low q(a), ohmic plasmas in CDX-U show stronger MHD activity as the edge safety factor is reduced. Those MHD modes appear to reduce the current ramp-up rate and, at present, limit the access to even lower q(a) regimes.

11827 (PPPL-Q–51) **FY93 Princeton Plasma Physics Laboratory. Annual report, October 1, 1992–September 30, 1993.** Princeton Univ., NJ (United States). Plasma Physics Lab. [1995]. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007352. Source: OSTI; NTIS; INIS; GPO Dep.

This is the annual report from the Princeton Plasma Physics Laboratory for the period October 1, 1992 to September 30, 1993. The report describes work done on TFTR during the year, as well as preparatory to beginning of D-T operations. Design work is ongoing on the Tokamak Physics Experiment (TPX) which is to test very long pulse operations of tokamak type devices. PBX has come back on line with additional ion-Bernstein power and lower-hybrid current drive. The theoretical program is also described, as well as other small scale programs, and the growing effort in collaboration on international design projects on ITER and future collaborations at a larger scale.

11828 (UCRL-JC–116862) **Fluctuations in high β_p plasmas in DIII-D.** Casper, T.A. (Lawrence Livermore National Lab., CA (United States)); Chu, M.S.; Gohil, C.P. Lawrence Livermore National Lab., CA (United States); General Atomics, San Diego, CA (United States). Jun 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9406270–4: 21. EPS conference on controlled fusion and plasma physics, Montpellier (France), 27 Jun - 1 jul 1994). Order Number DE95008071. Source: OSTI; NTIS; INIS; GPO Dep.

In our investigation of improved confinement in high poloidal beta (β_p = 2 to 4) advanced tokamak experiments, coincident with q_0

rising above 2, we observe the internal MHD activity to evolve from an m/n = 2/1 to a 3/1 structure consistent with the GATO code stability analysis. The plasma eventually evolves to a quiescent state at which time the stored energy increases, mostly as a result of improved particle confinement. The measured plasma pressure profiles during this time are also calculated to be stable to high-n ballooning modes consistent with operation of the core in the second stable regime. The sustained improvement in confinement is ultimately limited by our ability to control the toroidal current profile of which the bootstrap current contributes a large fraction (up to 80%).

11829 (UCRL-LR–105821-94-2, pp. 49-53) **Development of short pulse x-ray lasers for plasma probing.** Da Silva, L.B. (Univ. of Rochester, NY (United States)); Craxton, R.S.; London, R.A.; MacGowan, B.J.; Mrowka, S.; Matthews, D.L.; Frieders, G.; Wieland, T.L. Lawrence Livermore National Lab., CA (United States). [1994]. In *Inertial confinement fusion. Quarterly report, Volume 4, Number 2, January–March 1994.* 49p. Order Number DE95000314. Source: OSTI; NTIS.

Demonstrated soft x-ray lasers are either collisionally pumped systems in which inversions are produced in steady state conditions or recombination x-ray lasers that rely on transient inversion to achieve gain. The gain duration in conventional (also called quasi-static) recombination x-ray lasers, is determined by cooling and recombination rates and typically results in pulse widths >200 ps. This process allows very little control over the output pulse length without significantly reducing the total gain. Alternatively, short pulse widths are predicted for optical field ionized recombination x-ray lasers but these systems are yet to be demonstrated and require ultrashort pump lasers, which will severely limit the total output energy. Similar limitations exist for inner shell pumped x-ray lasers, which offer the possibility of short pulses and short wavelength. In contrast, collisionally pumped x-ray lasers achieve large gain length products and operate over a wide range of pump conditions and a variety of targets. In addition, their wide wavelength range (3.5 nm to 40 nm) makes them good candidates for several applications (e.g., biological imaging, nonlinear optics, and plasma imaging). An application that is becoming particularly important is the use of x-ray lasers for plasma diagnostics. By using moire deflectometry, the short wavelength of x-ray lasers has recently allowed the probing of large (3 mm) plasmas with electron peak densities exceeding $4 \times 10^{21} cm^{-3}$. These measurements were limited by using a collisionally pumped neon-like Y x-ray laser with an output pulse width of 200 ps FWHM. This pulse width is long enough that significant motion blurring can occur in most laser produced plasmas of interest. This article describes the efforts to generate short pulse collisionally pumped soft x-ray lasers with high peak powers.

11830 (UCRL-LR–105821-94-2, pp. 63-69) **Ray and wave optics modeling of laboratory x-ray lasers.** Ratowsky, R.P. (Univ. of Rochester, NY (United States)); Craxton, R.S.; London, R.A.; Feit, M.D.; Walling, R.W.; Shimkaveg, G.M. Lawrence Livermore National Lab., CA (United States). [1994]. In *Inertial confinement fusion. Quarterly report, Volume 4, Number 2, January–March 1994.* 49p. Order Number DE95000314. Source: OSTI; NTIS.

Because of the time and expense required for experimental shots on ICF class lasers such as Nova, the effective and efficient design of laboratory x-ray lasers largely depends on the authors ability to model accurately proposed experiments. They have therefore developed an x-ray laser modeling capability, using an approach that consists of a series of post-processing steps to a basic hydrodynamic simulation of the pump laser and target interaction. These steps include calculations of gain and propagation, the latter using both ray and wave optics. To date, most of the authors efforts have concentrated on the neon-like Y exploding foil x-ray laser. This article describes the state and scope of their modeling program and unresolved issues associated with the Y laser.

11831 (ANL/FPP/TM–277) **Summary report for ITER task - D10: Update and implementation of neutron transport and activation codes and processed libraries.** Attaya, H. Argonne National Lab., IL (United States). Jan 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ITER/US–95/IV-BL-17). Order Number DE95007631. Source: OSTI; NTIS; INIS; GPO Dep.

The primary goal of this task is to provide the capabilities in the activation code RACC, to treat pulsed operation modes. In addition, it is required that the code utilizes the same spatial mesh and geometrical models as employed in the one or multidimensional neutron transport codes used in ITER design. This would ensure the use of the same neutron flux generated by those codes to calculate the different activation parameters. It is also required to have the capabilities for generating graphical outputs for the calculated activation parameters.

11832 (BNL–61143) **Characterization of defects in deuterium-implanted beryllium.** Anderl, R.A. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Denison, A.B.; Szpala, S.; Asoka-Kumar, P.; Lynn, K.G.; Nielsen, B. Brookhaven National Lab., Upton, NY (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ; AC07-94ID13223. (CONF-940945–5: 5. international conference on hydrogen effects on material behavior, Moran, WY (United States), 11-15 Sep 1994). Order Number DE95005688. Source: OSTI; NTIS; INIS; GPO Dep.

This work investigated surface material modifications in high-purity beryllium foils resulting from 1-keV deuterium ion implantation into specimens for which the anneal temperatures and implantation temperatures were varied. Defects in unimplanted and in deuterium-implanted beryllium were characterized principally by positron-beam depth-profile analyses. Depth-profiles of the defect distributions in the specimens were made by stepping the energy of the positron beam from 0.055 keV to 40 keV, accompanied by measurements of the Doppler-broadened annihilation radiation line shape at each positron energy. These analyses identified a varying defect structure in beryllium, dependent on the previous anneal history of the material and on the temperature of the material during implantation with energetic deuterium ions. For specimens implanted at room temperature with 1-keV/D ions, the beam-induced defect structure had a profile that was peaked near the mean. range of the implanting deuterium and that extended beyond the implantation zone. Isochronal step-thermal anneal experiments revealed that deuterium was released from these defects at a temperature of about 400K, indicative of shallow traps, and that the defect structure annealed at temperatures above 623K. The beam-induced vacancy-defect complexes were estimated to be 1-nm voids for 1-keV/D implantation into Be at room temperature. For beryllium implanted at temperatures of 723K with 1-keV/D ions, these measurements revealed that the beam-induced defect structure was much broader and extended far beyond the implantation zone. Isochronal stepthermal anneal experiments for these specimens revealed a more stable defect structure, with the onset of defect annealing at 775K. There was no evidence of deuterium release at lower temperatures, indicating that for beryllium implanted at elevated temperatures, deuterium is retained in deep traps.

11833 (CONF-9301154–1-Vugraphs) **Development of ferritic/martensitic steels for fusion applications.** Bloom, E.E. Oak Ridge National Lab., TN (United States). [1993]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Fusion energy advisory committee meeting; Dallas, TX (United States); 13-15 Jan 1993. Order Number DE95007563. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains viewgraphs on the design and testing of ferritic and martensitic steels for fusion applications.

11834 (CONF-940507–43) **Status of nuclear data for ITER applications.** Larson, D.C. (Oak Ridge National Lab., TN (United States)); Cheng, E.T.; Mann, F.M.; Saji, G. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on nuclear data for science and technology: nuclear data for the twenty-first century; Gatlinburg, TN

(United States); 9-13 May 1994. Order Number DE95006749. Source: OSTI; NTIS; INIS; GPO Dep.

As the development of a near-term fusion reactor, such as the International Thermonuclear Experimental Reactor (ITER), enters the engineering design activity phase, one of the essential elements leading to the successful design, construction and operation of such a reactor is nuclear data. High quality nuclear data for all reactor materials relevant to ITER will be required in order to assess the nuclear performance, radiation damage, and safety and environmental aspects of all reactor components. In this paper the authors review the current ITER design, noting which materials and associated nuclear data are important in the various reactor components. They also review the contents of the Fusion Evaluated Nuclear Data Library (FENDL) accepted for use by ITER, and identify materials for which nuclear data improvements are required.

11835 (CONF-940843–14) **Pellet injector research and development at ORNL.** Combs, S.K. (and others); Barber, G.C.; Baylor, L.R. Oak Ridge National Lab., TN (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 18. European symposium on fusion technology; Karlsruhe (Germany); 22-26 Aug 1994. Order Number DE95006736. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory has been developing pellet injectors for plasma fueling experiments on magnetic confinement devices for more than 15 years. Recent major applications of the ORNL development program include (1) a tritium-compatible four-shot pneumatic injector for the Tokamak Fusion Test Reactor, (2) a centrifuge pellet injector for the Tore Supra tokamak, and most recently (3) a three-barrel repeating pneumatic injector for the DIII-D tokamak. In addition to applications, ORNL is developing advanced technologies, including high-speed pellet injectors, tritium injectors, and long-pulse pellet feed systems. The high-speed research involves a collaboration between ORNL and ENEA-Frascati in the development of a repeating two-stage light gas gun based on an extrusion-type pellet feed system. Construction of a new tritium-compatible, extruder-based repeating pneumatic injector (8-mm-diam) is complete and will replace the pipe gun in the original tritium proof-of-principle experiment. The development of a steady-state feed system in which three standard extruders operate in tandem is under way. These research and development activities are relevant to the International Thermonuclear Experimental Reactor and are briefly described in this paper.

11836 (CONF-940933–28) **Physics assessment of stellarators as fusion power plants.** Lyon, J.F. (Oak Ridge National Lab., TN (United States)); Rome, J.A.; Garabedian, P.R.; Anderson, D.T.; Painter, S.L. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (IAEA-CN–60/F-1-I-4). From 15. international conference on plasma physics and controlled nuclear fusion research; Seville (Spain); 26 Sep - 1 oct 1994. Order Number DE95007045. Source: OSTI; NTIS; INIS; GPO Dep.

Four different stellarator configurations (a Compact Torsatron, a new modular torsatron, Helias, and a new Modular Helias-like Heliac) were analyzed as fusion power plants and compared with the second-stability ARIES-IV tokamak. The device and plasma parameters were determined by minimizing the projected cost of electricity subject to various constraints. The stellarators were competitive with ARIES-IV for a range of assumptions on confinement models, alpha-particle losses, and beta. 1-D power balance equations were solved for both Lackner-Gottardi confinement scaling with an assumed $n_e(r)$ and for helical-ripple-induced transport with both assumed and calculated forms for $n_e(r)$ and $E_r(r)$.

11837 (CONF-941001–11) **Pumping characteristics of a cryopump with Ar sorbent in He and in D_2/He mixture.** Menon, M.M. (Oak Ridge National Lab., TN (United States)); Wade, M.R.; Maingi, R.; Hillis, D.L.; Laughon, G.J.; Mahdavi, M.A. Oak Ridge National Lab., TN (United States); General Atomics, San Diego, CA (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC03-89ER51114. (CONF-9410295–1: 41. annual American Vacuum Society symposium; 3. international conference on nanometer-scaled science and technology, Denver, CO (United States); Denver, CO (United States), 24-28 Oct 1994; 24-28 oct 1994). Order Number DE95007049. Source: OSTI; NTIS; GPO Dep.

The He ash generated as a result of D/T burn in a fusion reactor must be exhausted from the plasma to avoid fuel dilution effects. In view of this, transport and exhaust studies of He in fusion plasmas are getting increasing attention in recent years. In fusion plasmas, the exhaust gas will be a combination of D_2 and He, with He forming only a small fraction (about 10 %). The authors have investigated the cryosorption pumping characteristics of pure He and a mixture of D_2 and He (90 % D_2) using a cryosorption pump with condensed layers of Ar as sorbent. A cryocondensation pump cooled by liquid He at 4.3 K, and located in the outboard divertor region of the DIII-D tokamak, was used for the experiment. The investigation was conducted in a pressure regime that is relevant for particle exhaust from fusion plasmas. The experiment revealed that: (1) cryosorption pumping speed of pure He drops precipitously if the Ar/He ratio falls below about 20; (2) the pumping speed for He in a D_2/He mixture decreases in an exponential manner with the amount of D_2 pumped; (3) increasing the thickness of Ar in the range of 1 - 12 μm had little effect on the pumping speed for He in a D_2/He mixture; and (4) for a pumping surface coated with a thick (>2 μm) layer of Ar, surrounded by a radiation shield having a transparency factor of about 6, a He pumping speed in the range of 15-25 $m^3 s^{-1} m^{-2}$, in the millitorr pressure range for pulse duration of about 5 s can be obtained after pumping about 80 torr 1 of D_2.

11838 (CONF-941013–29) **The effect on stability and thermal hydraulic quenchback of perforating the jacket of a cable-in-conduit conductor.** Dresner, L. Oak Ridge National Lab., TN (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Applied superconductivity conference; Boston, MA (United States); 16-21 Oct 1994. Order Number DE95005392. Source: OSTI; NTIS; INIS; GPO Dep.

This Paper continues earlier work on the reduction of the quench pressure in a doubler cable-in-conduit conductor achieved by perforating the inner jacket. The present study examines the effect of the perforations on the stability margin and on the onset of thermal hydraulic quenchback.

11839 (EGG-M–94129) **Cobalt release from PCA steel during possible fusion reactor accidents.** Smolik, G.R.; McCarthy, K.A.; Hagrman, D.L.; McNew, E.B. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940843–13: 18. European symposium on fusion technology, Karlsruhe (Germany), 22-26 Aug 1994). Order Number DE95005019. Source: OSTI; NTIS; INIS; GPO Dep.

Possible accident scenarios for a fusion reactor include breaches in the vacuum or cooling system. Intruding air or steam could react with structural or plasma facing materials, possibly mobilizing radioactive isotopes. Safety assessments must consider the early dose at the site boundary from the release of these activated materials. Previous calculations have indicated that cobalt isotopes dominate dose calculations for designs using stainless steel. Values used in these calculations, however, had been largely determined by the measurement limits of the chemical analysis methodology instead of measured releases. The purpose of the current study was to refine the analytical method to reduce the limit for detecting cobalt, and then test PCA steel in air and steam between 973 and 1473 K. Goals were to obtain more accurate measurements of cobalt mobilization in terms of $g/m^2 \cdot h$ and insight into the mobilization mechanisms.

11840 (ENEA-RT-ERG–94-13) **Contributions to 6. international conference on fusion reactor materials.** ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone. Jan 1994. 36p. (In Italian). (CONF-930928–Vol.2: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG–94-13). Order Number DE95749681. Source: OSTI; NTIS (US Sales Only).

This paper contains the italian contributions to the 6. international conference on fusion reactor materials (Stresa, Italy, 27 september-1 october 1993).

11841 (ENEA-RT-ERG–94-13, pp. 5-16) **Experimental studies on hydrogen diffusion and trapping in martensitic and austenitic stainless steels for fusion application.** Benamati, G. (ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone - Area Nucleare); Donato, A.; Solina, A.; Valentini, R.; Lanza, S. ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone. Sep 1994. (CONF-930928–Vol.2: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG–94-13). In *Contributions to 6. international conference on fusion reactor materials.* 36p. Order Number DE95749681. Source: OSTI; NTIS (US Sales Only).

In the development of materials for the first wall and blanket, the presence of hydrogen, its permeation and the possible degradation of mechanical properties represent a key issue. This article presents experimental methods and results measurement of the diffusion coefficient, of the critical concentration for hydrogen-induced cracking and determination of the amount and biding energy of traps for several seeds of interest for nuclear fusion, among them Manet. The diffusion coefficient measurements were conducted electrochemically or by high temperature thermal analysis and data were extended, on the basis of the trap's theory, to a temperature range of considerable importance for nuclear fusion applications. With respect to the materials studied, analytical correlations are provided which describe the diffusion and trapping of hydrogen. The tests on the critical concentration of hydrogen are also presented and discussed. In the case of Manet these tests highlighted strong dependence of this parameter on the microstructure.

11842 (ENEA-RT-ERG–94-13, pp. 27-37) **Corrosion and low cycle fatigue properties of AISI 316 L in flowing Pb-17 Li.** Benamati, G. (ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone - Area Nucleare); Agostini, M.; Alessandrini, I.; Storai, S. ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone. Sep 1994. (CONF-930928–Vol.2: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG–94-13). In *Contributions to 6. international conference on fusion reactor materials.* 36p. Order Number DE95749681. Source: OSTI; NTIS (US Sales Only).

Corrosion and low cycle fatigue (LCF) tests were performed on AISI 316L steel in a flowing lithium lead environment. The LCF and corrosion tests were conducted simultaneously in the 'LIFUS 2' forced convection loop, at a temperature of 723 K anda flow velocity of approximately 0.01 m/s. The LCF tests, which had a strain amplitude ranging from 0. 008 to 0.016, were compared with reference tests performed in an inert argon atmosphere. The results show that liquid Pb-17Li has no detrimental effect on the LCF behaviour of 316 L at the test temperature of 723 K. The corrosion tests extended from 650 to 1600 hours with intermediate steps. Metallographic and SEM-EDAX analyses indicated the presence of an irregular porous ferritic layer. The results are discussed in terms of ferrite growth rate and the effect of corrosion phenomena on LCF behaviour.

11843 (ENEA-RT-ERG–94-13, pp. No pagination) **Thermomechanical cycling tests of coated AISI 316 L in Pb-17Li.** Benamati, G. (ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone - Area Nucleare); Elmi, N.; Agostini, M. ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone. Sep 1994. (CONF-930928–Vol.2: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG–94-13). In *Contributions to 6. international conference on fusion reactor materials.* 36p. Order Number DE95749681. Source: OSTI; NTIS (US Sales Only).

The permeation of tritium through the cooling pipes is one of the critical issues in the design of the Pb-17Li water-cooled blanket for the DEMO reactor. Aluminised coatings on the surfaces in contact with the Pb-17Li can significantly reduce the permeation rate through the steel and the tritium inventory in the blanket. A series of tests was conducted in order to verify the behaviour of these coatings in the presence of thermomechanical fatigue and in the Pb-17Li environment. The behaviour of the coatings, which sustained over one thousand thermal cycles in a temperature range of 260-320 degrees C and were subjected to an additional mechanical stress of 100 MPa, was satisfactory. The aluminised surfaces were found to be compatible with the breeder and no appreciable embrittlement attributable to the thermomechanical cycling was noted.

11844 (ENEA-RT-ERG-FUS–93-17) **Contributions to 6. international conference on fusion reactor materials.** ENEA, Frascati (Italy). Dipt. Fusione. Nov 1994. 68p. (CONF-930928–Vol.1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG-FUS–93-17). Order Number DE95749679. Source: OSTI; NTIS (US Sales Only).

The report containes italian contributions to the 6. international conference on fusion reactor materials. They describe the fusion experiments for investigating the outgassing behaviour of graphites, the properties of silicon films deposited on stainless steel surfaces held at 77K, the 14 MeV Frascati Neutron Generator (FNG) facility and auxiliary apparatus, the stainless steel bulk shielding benchmark experiment using the FNG.

11845 (ENEA-RT-ERG-FUS–93-17, pp. 5-18) **Outgassing tests on graphites in temperature range 373-1873 K.** Alessandrini, C. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Apicella, M.L.; Verdini, L. ENEA, Frascati (Italy). Dipt. Fusione. Nov 1993. (CONF-930928–Vol.1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG-FUS–93-17). In *Contributions to the 6. international conference on fusion reactor materials.* 68p. Order Number DE95749679. Source: OSTI; NTIS (US Sales Only).

Graphite is a an interesting material for plasma-facing components in fusion experiments, mainly because of its low atomic number and its excellent thermal properties. Nevertheless, it contains a large amount of gaseous impurities, which can be released by plasma-surface interaction and affect the purity of the deuterium-tritium plasma. To investigate the outgassing behaviour of graphites, CFCs and doped C composites, a facility has been set up to perform outgassing tests on samples (dim. 0.02x0.02x0.005 m), as a function of temperature in the range between 373 and 1873 K. The experimental apparatus, designed to work in UHV conditions, allows outgassing measurements by a quadrupole mass spectrometer (1-200 AMU), using two different methods. The test facility, the quadrupole calibration and quantitative outgassing measurements on SEP CARB N112 and DUNLOP V graphites are described.

11846 (ENEA-RT-ERG-FUS–93-17, pp. 19-28) **Silicon deposition on stainless steel surfaces in view of conditioning of FTU vacuum chamber.** Apicella, M.L. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Neri, A.; Traversari, G.; Cicala, M.G. ENEA, Frascati (Italy). Dipt. Fusione. Nov 1993. (CONF-930928–Vol.1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG-FUS–93-17). In *Contributions to 6. international conference on fusion reactor materials.* 68p. Order Number DE95749679. Source: OSTI; NTIS (US Sales Only).

The properties of silicon films deposited on stainless steel surfaces held at 77K, which is approximately the FTU (Frascati Tokamak Upgrade) wall temperature, have been investigated for the first time. Bad adherence and traces of peeling have been achieved by using the same experimental conditions foreseen for the machine: silane concentration in helium equal to (0.11-0.13), current density in the range (40-150)mA/m2. On the contrary, good results have been obtained on substrates held at 273K. This temperature represents a reasonable compromise for FTU operations.

11847 (ENEA-RT-ERG-FUS–93-17, pp. 55-68) **Stainless steel bulk shielding benchmark experiment at FNG.** Batistoni, P. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Angelone, M.; Martone, M.; Petrizzi, L.; Pillon, M.; Rado, V.; Santamarina, A.; Abidi, I.; Gastaldi, G.; Joyer, P. ENEA, Frascati (Italy). Dipt. Fusione. Nov 1993. (CONF-930928–Vol.1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG-FUS–93-17). In *Contributions to 6. international conference on fusion reactor materials.* 68p. Order Number DE95749679. Source: OSTI; NTIS (US Sales Only).

In the frame of the European Technology Program for NET/ITER, ENEA (Italian Agency for New Technologies, Energy and the Environment) - Frascati and CEA (Commissariat a' l'Energie Atomique, Cadarache (FR)) in collaboration, are performing a bulk shielding

benchmark experiment, using the 14 MeV Frascati Neutron Generator. The aim of the experiment is to obtain accurate experimental data for improving the nuclear data base and methods used in the shielding designs, through a rigorous analysis of the results. The experiment consists in the irradiation of a large SS-316 block by 14-MeV neutrons. The neutron fluxes and spectra at different depths, up to 65 cm inside the block, are measured by means of fission chambers and activation foils, characterized by different energy response ranges. Also the gamma-ray dose measurements are performed with ionization chambers and Thermo- Luminescence Dosimeters. The first results are presented, as well as the comparison with calculations by the Sn code BISTRO and the Monte Carlo code MCNP, using the european JEF/EFF libraries.

11848 (ETDE-IT–95-01) **High Z material operation in FTU.** Alladio, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Apicella, M.L.; Apruzzese, G.; Bartiromo, R.; Borra, M.; Bracco, G.; Buceti, G.; Buratti, P.; Centioli, C.; Ciotti, M. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). 1994. 8p. (CONF-9410249–3: International conference on plasma physics, Foz do Igacu (Brazil), 31 Oct - 4 nov 1994). Order Number DE95749678. Source: OSTI; NTIS (US Sales Only).

High Z materials, as possible plasma facing components for a fusion reactor, are being re-evaluated due to their advantages connected to the low sputtering yield and small erosion. A data base of experimental results related to their use on present Tokamak is missing. FTU has carried out a series of experiments with different medium and high Z limiter materials, Ni, Mo and W, to improve the knowledge of the plasma behaviour in these conditions. The results on plasma operation, core parameters, impurity content and corresponding radiation losses are presented, and compared with those obtained with a low Z dominant impurity (siliconization). A simple model coupling the SOL and the plasma core is able to reproduce the experimental results, indicating that sputtering and self-sputtering are the main physical mechanisms of impurity production.

11849 (ETDE-IT–95-04) **Discussion on prospects of fusion energy and on lines of development of improved tokamak reactors.** De Marco, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). ENEA, Frascati (Italy). Dipt. Fusione. 1994. 6p. (CONF-9409297–1: ISPP Workshop on Tokamak concept improvement, Varenna (Italy), 29 Sep - 3 oct 1994). Order Number DE95749695. Source: OSTI; NTIS (US Sales Only).

In this report it is summarised the contributions of the first day of the workshop and the ensuing discussions. The arguments were the role of fusion energy in different future outlooks of energy demand and consumption, the characteristics of an appealling Fusion Reactor, the principal technological and physical problems of the proposed Tokamak reactor projects.

11850 (ETDE-IT–95-07) **Physics and technology issues in our present view of design of a Tokamak reactor.** Andreani, R. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). ENEA, Frascati (Italy). Dipt. Fusione. 1994. 17p. (CONF-9409297–2: ISPP Workshop on Tokamak concept improvement, Varenna (Italy), 29 Sep - 3 oct 1994). Order Number DE95749701. Source: OSTI; NTIS (US Sales Only).

The present conceptual designs of Tokamak reactors are generally driven by economical reasons towards steady state operation, smaller plasma current and reduced size. This evaluation finds its justification in the assumption of more or less optimistic improvements in physics and technology with respect to the present situation. Hopefully most of the problems associated with power and particle exhaust, ash removal, plasma disruptions, burn control will be solved in ITER. Therefore these problems will only be touched upon in this lecture? The physics needs about confinement, beta, profile control, will also be shortly analysed and compared with the already achieved results. The physics issues will be the argument of most of the lecture in this workshop. More attention will be devoted to what extrapolation is needed and can be foreseen in the technology of magnets, first wall, blanket. The requirements on structural and protection materials with respect to mechanical properties, heat transmission capability, fatigue, neutron damage and activation lifetime will be analysed and the necessary developments and R&D outlined.

11851 (ETDE-IT–95-13) **Temperature growth-up and mechanical loads on ENEA facility CICC test.** Gasparotto, M. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Pasotti, G.; Roccella, M.; Lucca, F. ENEA, Frascati (Italy). Dipt. Fusione. 1994. 18p. (CONF-9409296–1: MSC European users' conference, Turin (Italy), 19-20 Sep 1994). Order Number DE95749713. Source: OSTI; NTIS (US Sales Only).

ENEA (Italian Agency for New Technoligies, Energy and the Environment), under an ITER Technology Task (MSUB2-Stability, Ramp Rate and AC Loss Experiments for ITER), is engaged in the test of a 12 T coil, made by a cable-in-conduit Nb3S n conductor with the wind and react approach. The Task proposal is to face many of the technological problems that will be met in the construction of the ITER magnet. The coil will undergo an a. c. test (ITER relevant) at ENEA. Here the preliminary numerical analysis, performed using the MSC/EMAS code, on the a.c. test are reported. The results concern the forces and the temperature growths for ohmic dissipation due to eddy currents on the metallic structures surrounding the coil.

11852 (INIS-mf–14441) **ITER EDA Newsletter. V. 3, no. 7.** International Atomic Energy Agency, Vienna (Austria). Jul 1994. 8p. Order Number DE95619544. Source: OSTI; NTIS (US Sales Only); INIS.

This ITER EDA (Engineering Design Activities) Newsletter issue reports on the sixth meeting on the ITER management advisory committee (MAC-6); on the sixth meeting of the ITER technical advisory committee (TAC-6); a summary of a magnet technical meeting, held at Naka, Japan, June 27-30 1994 is also included. It finally contains an in memoriam on the passing away of Dr. A.I. Kostenko.

International Conference on Plasma Surface Interactions in Controlled Fusion Devices, Mito-shi, Japan, May 23-27, 1994; (4) 21th EPS Conference on Controlled Fusion and Plasma Physics, Montpellier, June 27 to July 1, 1994. (HP)

11857 (JAERI-M–94-019, pp. 42-54) **The ITER blanket and shield design status as of September 1993.** Gohar, Y. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data*. 441p. Order Number DE94012554. Source: OSTI; NTIS; INIS.

The design and the current data basis of the first wall, blanket and shield of the ITER are shown. The advanced blanket is of self-cooled lithium-vanadium design with electrical insulation, and the shield is composed of water, copper and steel, and their features are explained. The drawings of poloidal flow concept, the helium-cooled inner blanket, the water-cooled, copper face inner blanket and the toroidal plate shield are shown. The requirement and cost of tritium based on 1 GW of fusion power for different fluence goals and breeding potential are given. The machine parameters and the thermal hydraulic parameters by the thermal hydraulic analysis of the self-cooled inboard blanket for 3 GW fusion power, and the thermal hydraulic parameters for helium-cooled design and for different outlet helium temperature are shown. The assessment of liquid metal coolants for the ITER on their advantages and disadvantages and lifetime insulator performance is done. Liquid metal electrical insulators, aluminized coating on structural materials, lithium-vanadium corrosion and compatibility issues, the assessment of water coolant, helium coolant and structural materials for the ITER, austenitic and ferritic stainless steels and vanadium alloys are described. (K.I.).

11858 (JAERI-Research–94-020) **Control characteristics of a cascade composed of cryogenic distillation columns with feedback streams.** Yamanishi, Toshihiko (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Okuno, Kenji. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 27p. Order Number DE95747847. Source: OSTI; NTIS; INIS.

A control method was proposed for a two-column cascade composed of cryogenic distillation columns with feedback streams. The lead column process the exhaust gas from a plasma, and produces high purity tritium. The second column process the top stream from the lead column and hydrogen gases containing tritium from water detritiation and blanket systems. The top and bottom flow rates of the columns are adjusted against variations of feed compositions to control product purity. The method of parameter setting for the proportional-integral (PI) controller was proposed for step changes of the feed compositions. For the lead column, either the mole fraction of DT at top or the atom fraction of T at bottom can be chosen as the controlled variable. The mole fraction of DT is more favorable as the controlled variable than the atom fraction of T from the viewpoint of promptness of the control. However, only a short time lag in the measurement of the controlled variable is permissible. It is required to decrease the value for the proportional sensitivity to relax this restrict. The successful control is obtained for the second column to choose the mole fraction of HT at top. A considerably long time lag is permitted for the second column in contrast to the lead column. (author).

11859 (JAERI-Tech–94-019) **Pre-analyses of SS316 and SS316/Water Bulk Shielding Experiments.** Konno, Chikara (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Maekawa, Fujio; Iwai, Atsushi; Ikeda, Yujiro; Oyama, Yukio; Maekawa, Hiroshi; Kosako, Kazuaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 50p. Order Number DE95747846. Source: OSTI; NTIS; INIS.

As one of the '93 ITER/EDA emergency tasks, JA-3 (Bulk Shielding Experiments) was authorized. This report compiled the pre-analyses for the SS316 and SS316/Water experiments. The pre-analysis of SS316 experiment was performed to determine the size and configuration of the experimental assembly using the discrete ordinate code DOT3.5 and the FUSION-40 nuclear data library. The calculation suggested that the assembly should be a cylindrical shape, the diameter and thickness of which were 1.2 m and 1.1 m, respectively. The 0.2 m thick SS316 source reflector was also necessary to simulate fusion reactor neutron environment and to decrease room returned background neutrons. In the SS316/Water experiment, the volume ratio of SS316 to water was adopted to be 4:1, which was recommended in ITER/CDA. The basic size of the SS316/water experimental assembly was set to be the same as the SS316 experimental assembly. The heterogeneity effect on the shielding performance due to the layered structure of SS316 and water was not so large in the water layer up to 30 mm in thickness. The method how to reduce background by room returned neutrons was examined. In order to calculate neutron reflection by the wall of the experimental room precisely, the S_N code DOT-DD and the multigroup double-differential form cross section library DDXLIB3 were used instead of the DOT3.5 code. The calculation pointed out the following results. (1)The S/N (Signal to Noise ratio) was 0.5 at the depth of 0.9 m if there was no additional shield. (2)A 0.1 m thick additional polyethylene layer decreased background neutrons to 1/10. (3)A 0.4 m thick source reflector was not so effective since it reduced background by only a half. The additional shield of the polyethylene thicker than 0.1 m was found to be the most preferable. The final experimental configurations of the SS316 and SS316/Water experiments were determined according to these pre-analyses. (author).

11860 (JAERI-Tech–94-022) **Critical element study on autonomous position control of articulated-arm type manipulator.** Oka, Kiyoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kakudate, Satoshi; Nakahira, Masataka. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 28p. Order Number DE95747883. Source: OSTI; NTIS; INIS.

An articulated-arm type manipulator can be operated effectively in a restricted space due to its flexibility and it can be attractive for a wide range of in-vessel maintenance such as viewing, inspection and limiter handling in fusion experimental reactors. In case of the in-vessel maintenance using a flexible manipulator, it is quite essential to develop an autonomous control method for compensating a deflection of manipulator so as to minimize the maintenance time with high precision. For this purpose, a new position control method using a combination of neural network predictor with a rigid inverse kinematics is being developed. The key features of this method are to simplify a kinematics modeling of flexible manipulator, to enable quick position compensation in stead of ordinary large matrix compensation, and to be applicable to a wide variety of manipulator characteristics. A sub-scaled model of flexible manipulator with 4 joints has been fabricated for a benchmark experiments of the autonomous position control. Comparing analytical simulation with experiments using the flexible manipulator, it has been demonstrated that the new position control method gives significant improvement in control performance with high precision in order of a figure. In addition, further optimization can be possible by adding other non-linear predictors such as radial basis function and fuzzy modeling. This paper describes the details of a sub-scaled flexible manipulator and a neural network position control system as well as results of analytical simulation and benchmark experiments. (author).

11861 (Juel–2942) **Development of a FE method for modelling plasma flows in tokamak plasma edges.** Puetz, T. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Plasmaphysik; Duesseldorf Univ. (Germany). Jul 1994. 168p. (In German). Order Number DE95756173. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the work is to to develop a two-dimensional Finite-Element-Code. This code should be able to simulate the plasma flow pattern in the burning chamber of fusion devices by an exact and solution-dependent discretisation. Reionisation and other collision processes of recycled neutral particles are described by coupling the fluid model to the kinetic Monte-Carlo neutral-gas-code EIRENE. For comparison and fundamental numerical studies a fast analytical description of recycling is also available. Such rather crude approximations are employed in other codes often as the only option. It is possible to treat the flow of ions and neutral atoms/molecules near complex surface structures of fusion devices

consistently. Because of the time step restriction in the special solution algorithm, up to now the electron temperature profile has to be provided from elsewhere. It can, for example be interpolated from experimental data or from results of other independent code calculations. The newly developed code is applied to a typical TOKAMAK-discharge (TEXTOR) and characteristic results are discussed. (orig./HP)

11862 (KFK–5374) **Investigations about the outgassing behaviour of the walls of a Tokamak fusion reactor.** Kunz, I. (Magdeburg Univ. (Germany). Fakultaet fuer Naturwissenschaften). Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorsicherheit; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Jul 1994. 81p. (In German). Order Number DE95756175. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper represents a "state of the art"-review about some aspects of outgassing. First some theoretical models of outgassing and models for calculating outgassing rates will be discussed. The adsorption-diffusion-model of MALEV is considered as the most universal model and will be presented detailed. Finally some methods for the measurement of small outgassing rates, some selected measuring results and possible surface preparation methods reducing the outgassing rate for practical working are presented. (orig.)

11863 (KFK–5381) **The first wall test facility FIWATKA - description of the facility and report on commissioning tests.** Hofmann, G.; Eggert, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Angewandte Thermo- und Fluiddynamik (IATF); Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Sep 1994. 77p. Order Number DE95752105. Source: OSTI; NTIS (US Sales Only); INIS.

A facility for performing thermo-mechanical cycle tests (thermal fatigue tests) was designed and constructed. Such tests are in support of the design of first wall structures for fusion reactors. The requirements necessary to achieve the test goals are outlined. The facility and its components are described; its upgrading capabilities are discussed. The main commissioning tests are reported. It is concluded that the facility is ready to perform thermal fatigue tests; the capability of the facility includes the testing of specimens with high surface temperatures. (orig.)

11864 (KFK–5409) **Strength and crack growth data for fusion relevant ceramics.** Fett, T. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Nov 1994. 43p. Order Number DE95755524. Source: OSTI; NTIS (US Sales Only); INIS.

Microwave heating is being considered as an external plasma heat source for fusion reactor systems. The window separating the reactor vacuum and the electron tube vacuum is heated up as a result of dielectric losses. The temperature gradients in the window cause thermal stresses. These stresses are responsible for failure and finite lifetimes of the ceramic materials. Three failure modes are of special interest: Spontaneous failure, failure after subcritical crack growth and cyclic fatigue leading to a finite lifetime. A number of ceramic materials has been investigated. The results are reported by Weibull plots (strength), v-K-curves (subcritical crack growth) and da/dN-ΔK-curves (cyclic fatigue). For a number of materials also the fracture toughness $K_{I,c}$ is given. (orig.)

11865 (LA-UR–94-3115) **Indirectly driven targets for ignition.** Wilson, D.C.; Krauser, W.J. Los Alamos National Lab., NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36 ; W-7405-ENG-48. (CONF-9409226–4: ECLIM 23: laser interaction with matter, Oxford (United Kingdom), 19-23 Sep 1994). Order Number DE95006451. Source: OSTI; NTIS; INIS; GPO Dep.

Both Los Alamos and Lawrence Livermore Laboratories have studied capsule and laser driven target designs for the National Ignition Facility. The current hohlraum design is a 2.76mm radius, 9.5mm long gold cylinder with 1.39mm radius laser entrance holes covered by 1 μm thick plastic foils. Laser beams strike the inside cylinder wall from two separate cones with a peak power less than 400 TW. The problem with a pressure pulse caused by wall plasma stagnating on axis has been overcome by filling the hohlraum with gas. Currently this is equi-molar hydrogen-helium gas at 0.83 mg/cc density. One capsule uses a 160 μm plastic ablator doped with oxygen and bromine surrounding an 80 μm thick DT ice layer with an inner radius of 0.87 mm. Los Alamos integrated calculations of the hohlraum and this capsule using 1.4 MJ of laser energy achieve yields of 4.9 MJ using LTE atomic physics, and 3.5 MJ with non-LTE. This confirms Livermore calculations of ignition. For radiation driven implosions, a beryllium ablator offers a viable alternative to plastic. It is strong enough to contain high DT pressures. Copper, soluble at required levels, is an excellent dopant to add opacity. A beryllium capsule with a 155 μm thick ablator doped with 0.9 atom % copper, and the same inner dimensions as the plastic capsule, placed in a similar hohlraum , yields 6.9 MJ with LTE. Although these calculations show the designs are sensitive, they add to the confidence that NIF can achieve ignition. Using their best integrated calculations which are not yet fully optimized, they confirm Livermore calculations of ignition with a plastic capsule, and have added an alternate capsule design with a beryllium ablator.

11866 (LA-UR–94-3834) **Spectral broadening of KrF laser radiation by self-seeded Raman amplification in long air paths.** Kurnit, N.A.; Thompson, D.C.; Thomas, S.J.; Steele, H.S. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950540–2: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95003697. Source: OSTI; NTIS; INIS; GPO Dep.

Broadening of the spectral content with little loss of focusability has been demonstrated in nearly-collimated propagation of KrF laser pulses having spectral components that overlap the rotational Raman lines in air.

11867 (LA-UR–94-4354) **Magneized target fusion: An overview of the concept.** Kirkpatrick, R.C. Los Alamos National Lab., NM (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411182–1: 1. international symposium for evaluation of current trends in fusion research, Washington, DC (United States), 14-18 Nov 1994). Order Number DE95005247. Source: OSTI; NTIS; INIS; GPO Dep.

Magnetized target fusion (MTF) seeks to take advantage of the reduction of thermal conductivity through the application of a strong magneticfield and thereby ease the requirements for reaching fusion conditions in a thermonuclear (TN) fusion fuel. A potentially important benefit of the strong field in the partial trapping of energetic charged particles to enhance energy deposition by the TN fusion reaction products. The essential physics is described. MTF appears to lead to fusion targets that require orders of magnitude less power and intensity for fusion ignition than currently proposed (unmagnetized) inertial confinement fusion (ICF) targets do, making some very energetic pulsed power drivers attractive for realizing controlled fusion.

11868 (LA-UR–95-426) **Targets for laser-driven opacity measurements.** Gobby, P.L.; Bush, H. Jr.; Gurule, V.A.; Gomez, V.M.; Moore, J.E.; Henneke, B.F. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941041–1: 17. biennial world conference of the International Nuclear Target Development Society: targets, research materials and related topics of hadron physics, Bloomington, IN (United States), 17-21 Oct 1994). Order Number DE95006172. Source: OSTI; NTIS; GPO Dep.

Special laser targets have been designed and fabricated which allow the opacity of materials to be experimentally determined at elevated temperatures ($kT \leq 200$ eV). A general description of the technique is presented, as well as the fabrication steps necessary to produce the targets. A uniform high temperature environment is provided by the use of small millimeter-sized hohlraums driven by the Nova laser at Lawrence Livermore National Laboratory. The material sample is placed within the hohlraum and is further illuminated by the x-rays produced by one or two of the Nova beams incident on a second material known as a back lighter. Thus far, silver and niobium opacity samples have been used, and each has required a different fabrication technique.

11869 (NIFS–290) **Innovative divertor concepts for LHD.** Ohyabu, N. (and others); Komori, A.; Akaishi, K. National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 18p. Order Number DE95747841. Source: OSTI; NTIS; INIS.

We are developing various innovative divertor concepts which improve the LHD plasma performance. These are two divertor magnetic geometries (helical and local island divertors), three operational scenarios (radiative cooling in the high density, cold boundary, confinement improvement by generating high temperature divertor plasma and simultaneous achievement of radiative cooling and H-mode like confinement improvement) and technological development of new efficient hydrogen pumping schemes. (author).

11870 (NIFS–292) **Boronization study for application to large helical device.** Noda, N. (and others); Sagara, A.; Yamada, H. National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 21p. Order Number DE95747839. Source: OSTI; NTIS; INIS.

An experimental device named SUT (SUrface modification Teststand) was constructed for a boronization study. An ultra high vacuum (UHV) condition, a changeable high temperature liner and in-situ AES are three distinctive feature of the SUT device. Saturation density of oxygen atoms was as large as $1.2x10^{17}/cm^2$ on a boronized surface, whereas $1.5x10^{16}/cm^2$ on a bare stainless steel surface. It is found by AES analysis that the oxygen-contained layer was as thick as 50 nm from the top surface of the boron film. From such a large oxygen-saturation density, we expect that the oxygen-gettering ability of the boronized surface is likely to be maintained during one-day experiment of LHD. The oxygen-saturation behavior was quite similar between the boronized surfaces obtained with decaborane and diborane, which indicates that, as a working gas of the boronization, the decaborane works well compared with diborane, as far as oxygen gettering is concerned. (author).

11871 (NIFS–294) **Experimental study on scaling law of outgassing rate with a pumping parameter.** Akaishi, Kenya; Kubota, Yusuke; Ezaki, Kazuhiro; Motojima, Osamu. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 19p. Order Number DE95747837. Source: OSTI; NTIS; INIS.

The outgassing rate of a small test chamber made of 304 type stainless steel has been measured as a function of pumping speed in a range from 0.3 to 200 μs. In the experiment the chamber has been first exposed to the air and then pumped with different pumping speeds for 3 days at room temperature of 20 degC without baking. The typical outgassing rates of the chamber are determined from the measurement of steady pressures at the pumping time of 72 h. As a result of experiment, it is found that measured outgassing rates q obey a set of power laws of $q_1=c_1(S/A)^{m}1$ and $q_2=c_2(S/A)^{m}2$ where S/A is the ratio of pumping speed S to surface area A of the chamber, c_1 and c_2 are constants, exponents of m_1 and m_2 are 0.8282 for $S/A \geq 10^{-3}$ μ/scm^2 and 0.4655 for $S/A \leq 10^{-3}$ μ/scm^2, respectively. Technical application of the obtained scaling law is discussed in connection with the design of pumping system for a large vacuum device. (author).

11872 (NIFS–297) **New evaluation method of superconductor characteristics for realizing the Large Helical Device.** Yamamoto, J. (and others); Motojima, O.; Mito, T. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 18p. Order Number DE95747835. Source: OSTI; NTIS; INIS.

It is necessary to apply extra large scale superconducting magnets for a fusion device like Large Helical Device (LHD). Because of the relatively large current (10kA or more), new evaluation method to determine the fundamental characteristics of superconductors have to be developed, which are already established for thin superconducting wires. In this paper, a measuring method of critical current, stability margin, current distribution are mainly discussed. Bath-cooled composite type and supercritical helium force-cooled type NbTi conductors have been chosen for helical coils and poloidal coils of LHD, respectively. A critical current of a conductor was measured as follows. Two 2 m long parallel conductors, which were connected each other at the bottom, were inserted in a 9 T split coil. The surface of the conductor was covered 50% by spacers to simulate heat transfer conditions. The time dependent transition phenomena between normal and superconducting state are observed by voltage distribution along the conductor. On study of forced flow cooled conductors, the current transfer from a quenching strand to another strand was measured by pick up coils on a conduit. We measured its stability margin by a pancake-type coil as a long sample test. The major measurement results of bath- and forced-cooled LHD conductors using this system have given enough fundamental data of high current multistrand conductors for the LHD. (author).

11873 (NIFS–298) **Local island divertor concept for LHD.** Komori, A. (and others); Ohyabu, N.; Watanabe, T. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 17p. Order Number DE95747834. Source: OSTI; NTIS; INIS.

A local island divertor (LID) has been proposed for the edge plasma control of the Large Helical Device (LHD), and its functions and effects on edge plasmas have been studied in detail. Although the LHD edge plasma will primarily be controlled by a closed full helical divertor, the LID will be used as an alternative. The advantage of the LID over the helical divertor is technical ease of the hydrogen pumping because of its toroidally localized recycling. A significant feature of the LID is high overall pumping efficiency of > or approx 30%, which is the key in realizing high temperature divertor operation, leading to a significant energy confinement improvement. (author).

11874 (PPPL–3043) **Princeton Plasma Physics Laboratory (PPPL) annual site environmental report for calendar year 1993.** Finley, V.L.; Wiezcorek, M.A. Princeton Univ., NJ (United States). Plasma Physics Lab. Jan 1995. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007351. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives the results of the environmental activities and monitoring programs at the Princeton Plasma Physics Laboratory (PPPL) for CY93. The report is prepared to provide the U.S. Department of Energy (DOE) and the public with information on the level of radioactive and non-radioactive pollutants, if any, added to the environment as a result of PPPL operations, as well as environmental initiatives, assessments, and programs that were undertaken in 1993. The objective of the Annual Site Environmental Report is to document evidence that DOE facility environmental protection programs adequately protect the environment and the public health. The Princeton Plasma Physics Laboratory has engaged in fusion energy research since 1951. The long-range goal of the U.S. Magnetic Fusion Energy Research Program is to develop and demonstrate the practical application of fusion power as an alternate energy source. In 1993, PPPL had both of its two large tokamak devices in operation; the Tokamak Fusion Test Reactor (TFTR) and the Princeton Beta Experiment-Modification (PBX-M). PBX-M completed its modifications and upgrades and resumed operation in November 1991. TFTR began the deuterium-tritium (D-T) experiments in December 1993 and set new records by producing over six million watts of energy. The engineering design phase of the Tokamak Physics Experiment (TPX), which replaced the cancelled Burning Plasma Experiment in 1992 as PPPL's next machine, began in 1993 with the planned start up set for the year 2001. In 1993, the Environmental Assessment (EA) for the TFRR Shutdown and Removal (S&R) and TPX was prepared for submittal to the regulatory agencies.

11875 (PPPL-CFP–3180) **Summary discussion: An integrated advanced tokamak reactor.** Sauthoff, N.R. Princeton Univ., NJ (United States). Plasma Physics Lab. [1994]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9408189–2: ISPP workshop on tokamak concept improvement, Varenna (Italy), 29 Aug - 3 sep 1994). Order Number DE95005534. Source: OSTI; NTIS; INIS; GPO Dep.

The tokamak concept improvement workshop addressed a wide range of issues involved in the development of a more attractive tokamak. The agenda for the workshop progressed from a general discussion of the long-range energy context (with the objective being the identification of a set of criteria and "figures of merit" for measuring the attractiveness of a tokamak concept) to particular opportunities for the improvement of the tokamak concept. The discussions concluded with a compilation of research program elements leading to an improved tokamak concept.

11876 (UCRL-JC–117107) **Scrape-off layer plasma modeling for the DIII-D tokamak.** Porter, G.D. (and others); Rognlien, T.D.; Allen, S.L. Lawrence Livermore National Lab., CA (United States). Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940933–38: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95008059. Source: OSTI; NTIS; INIS; GPO Dep.

The behavior of the scrape-off layer (SOL) region in tokamaks is believed to play an important role determining the overall device performance. In addition, control of the exhaust power has become one of the most important issues in the design of future devices such as ITER and TPX. This paper presents the results of application of 2-D fluid models to the DII-D tokamak, and research into the importance of processes which are inadequately treated in the fluid models. Comparison of measured and simulated profiles of SOL plasma parameters suggest the physics model contained in the UEDGE code is sufficient to simulate plasmas which are attached to the divertor plates. Experimental evidence suggests the presence of enhanced plasma recombination and momentum removal leading to the existence of detached plasma states. UEDGE simulation of these plasmas obtains a bifurcation to a low temperature plasma at the divertor, but the plasma remains attached. Understanding the physics of this detachment is important for the design of future devices. Analytic studies of the behavior of SOL plasmas enhance our understanding beyond that achieved with fluid modeling. Analysis of the effect of drifts on sheath structure suggest these drifts may play a role in the detachment process. Analysis of the turbulent-transport equations indicate a bifurcation which is qualitatively similar to the experimentally different behavior of the L- and H-mode SOL. Electrostatic simulations of conducting wall modes suggest possible control of the SOL width by biasing.

11877 (UCRL-JC–118719) **Attractive characteristics of mirrors.** Post, R.F.; Ryutov, D.D. Lawrence Livermore National Lab., CA (United States). 15 Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941182–2: 6. international Toki conference on plasma physics and controlled nuclear fusion: Research for advanced concepts in magnetic fusion, Toki-city (Japan), 29 Nov - 2 dec 1994). Order Number DE95008073. Source: OSTI; NTIS; INIS; GPO Dep.

A summary of the attractive characteristics of mirror devices is presented. Recent progress in development of axisymmetric mirror devices is described. Potentialities of mirrors as a basis for D^3He fusion power generators and high-flux neutron sources for fusion material tests are discussed.

11878 (UCRL-LR–105821-94-2, pp. 54-62) **Surface finish of plasma polymer ablator layers.** Letts, S.A.; Collins, G.W.; Fearon, E.M.; McEachern, R.L.; Bernat, T.P.; Saculla, M.D. Lawrence Livermore National Lab., CA (United States). [1994]. In *Inertial confinement fusion. Quarterly report, Volume 4, Number 2, January–March 1994.* 49p. Order Number DE95000314. Source: OSTI; NTIS.

Plasma polymers have been used for many years as the ablator layer of ICF targets. The surface finish for the ablator coating must be microscopically smooth. Previously, to improve the surface finish, the authors varied one parameter at a time and assessed the surface finish using optical or scanning electron microscopy. They found the causes of surface roughness in plasma polymers can be separated into two categories: surface particle contaminants and chemical vapor deposition process dynamics. Surface roughness originating from surface particles is easily described by a geometric growth model, that explains the dome-shaped surface defects observed on otherwise smooth coatings. Particles may also be produced in the deposition process by three mechanisms: stress-induced particle production, nucleation in the gas phase, or etching from polymers deposited on the walls of the coating system. The role of deposition process dynamics in surface finish has been difficult to measure. With the availability of atomic force microscopy (AFM), a quantitative analysis of process conditions on surface finish became possible. Using AFM, the authors measured surface roughness in an effort to determine the scaling behavior of plasma-polymer films with coating thickness, deposition rate, and substrate temperature. This paper describes the development of their plasma polymer surface finish measuring techniques and analytical methods. The results have greatly increased the authors understanding of the plasma polymerization mechanism and their ability to explain and predict surface finish behavior.

11879 (UCRL-LR–105821-94-2, pp. 70-77) **A comparison of driver concepts for heavy-ion fusion.** Sharp, W.M. Lawrence Livermore National Lab., CA (United States). [1994]. In *Inertial confinement fusion. Quarterly report, Volume 4, Number 2, January–March 1994.* 49p. Order Number DE95000314. Source: OSTI; NTIS.

The basic concern of inertial confinement fusion is depositing enough energy in the shell of a target in a sufficiently short time. Heavy-ion accelerators are an attractive candidate for a driver for inertial-fusion energy, both because their beams can transfer energy efficiently to targets, and because they can deliver large peak powers with manageable currents. One problem confronting ion drivers is the scaling of target gain, usually defined as the ratio of fusion energy generated to the input kinetic energy. Gain typically increases with increasing energy on target, decreasing beam focal-spot size, and decreasing range, which corresponds to a lower energy per ion. In contrast, ion accelerators are conventionally designed to deliver low current and high energy per ion, and, at higher currents, the beam space charge and transverse temperature tend to give a large spot size. The engineering problem for heavy-ion drivers is to obtain sufficiently concentrated energy while still focusing, steering, and finally aiming the beam. The economic problem is doing this at a cost that is competitive with other energy sources. This paper presents and briefly compares the principal concepts for heavy-ion drivers. Target requirements are first used to choose a typical set of accelerator specifications, and the paper then reviews the approaches being taken by European and American research groups to develop a driver for heavy-ion fusion (HIF). A final section discusses experimental work on HIF.

99 GENERAL AND MISCELLANEOUS

11880 (CONF-9405263–Summ.) **Science, engineering and technical service capabilities of Nevada higher education organizations.** Nevada Univ., Las Vegas, NV (United States). Sep 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. From Alliance for education research and training opportunities (AERTO); Ely, NV (United States); 31 May - 2 jun 1994. Order Number DE95003616. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to increase the current dialogue between members of Nevada's higher education system and the leadership of the federal scientific community in Nevada in order to start and expand collaborative relationships. This section provides introductory material on Nevada institutions of higher education and research together with background information on the need for increased federal collaboration with Nevada higher education institutions.

11881 (ETDE-DE–27) **The VEBA group 1994/'95. Data of October 1994.** VEBA AG, Duesseldorf (Germany). [1994]. 245p. (In German). Order Number DE95753793. Source: OSTI; NTIS (US Sales Only).

The book presents subsidiaries and associated companies of the VEBA group in the fields of electricity, chemistry, oil, and trade/transportation/services. (UA)

11882 (ORNL/PPA–94/3) **Oak Ridge National Laboratory Institutional Plan, FY 1995–FY 2000.** Oak Ridge National Lab., TN (United States). Nov 1994. 232p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008785. Source: OSTI; NTIS; GPO Dep.

This report discusses the institutional plan for Oak Ridge National Laboratory for the next five years (1995-2000). Included in this report are the: laboratory director's statement; laboratory mission, vision, and core competencies; laboratory plan; major laboratory initiatives; scientific and technical programs; critical success factors; summaries of other plans; and resource projections.

The activities and purposes of the Personnel Monitoring Dept. of the Institute of Radioprotection and Dosimetry of the Brazilian CNEN are presented. A summary of the personnel monitoring service is given, such as dosemeters supply, laboratorial inspections, and so on. The programs of working, publishing, courses and personnel interchange are also presented. (J.A.M.M.).

11890 (INIS-mf–14437-Vol.6) **Vol. 6: Database of problems for qualification examinations.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95619154. Source: OSTI; NTIS (US Sales Only); INIS.

The publication contains a set of problems for the written and oral parts of state examinations of selected personnel of research nuclear facilities. The problems concentrate on reactor theory in general and on the design and safety of the LVR-15, LR-0 and VR-1 research reactors in particular. The structure of the problem database and of the software for generation of the examination tests are described. (J.B.).

11891 (INIS-mf–14456) **Annual report 1992-93.** Atomic Energy Regulatory Board, Bombay (India). [1993]. 35p. Order Number DE95619156. Source: OSTI; NTIS (US Sales Only); INIS.

The mission of the Atomic Energy Regulatory Board (AERB) is to ensure that the use of ionizing radiation and nuclear energy in India does not cause undue risk to health, safety and the environment, and in it's function is supported by various Advisory Committees. The annual report of AERB for the year 1992-93 contains brief safety reviews of the new and existing nuclear power plants in India, details about the safety standards, codes and guidelines being followed in the nuclear facilities, regulatory procedures to be adopted in all the installations using radioactive materials and relevant details of other important activities of the Board. The report also contains annexures which give details about the constitution of various committees of the Board and AERB. (M.K.V.).

11892 (INIS-mf–14462) **Annual report 1991.** Ustav Jaderneho Vyzkumu a.s., Rez (Czech Republic). Jul 1992. 28p. Order Number DE95619157. Source: OSTI; NTIS (US Sales Only); INIS.

A review is presented of the economic data and activities of the Nuclear Research Institute (NRI) at Rez. The income, operating expenditures and number of man-years employed (total staff and university graduates) are given for the NRI as a whole and separately for the Division of Nuclear Power and Safety, Division of Reactor Materials, Division of Fuel Cycle Chemistry, Division of Reactor Physics, Division of Radionuclides and Ionizing Radiation, Central Analytical Laboratory, and Research Reactor Laboratory. (J.B.).

11893 (INIS-mf–14463) **Annual report 1992.** Ustav Jaderneho Vyzkumu a.s., Rez (Czech Republic). May 1993. 34p. Order Number DE95619158. Source: OSTI; NTIS (US Sales Only); INIS.

A review is presented of the economic data and activities of the Nuclear Research Institute (NRI) at Rez. The income, operating expenditures and number of man-years employed (total staff and university graduates) are given for the NRI as a whole and separately for the Nuclear Power and Safety Division, Reactor Materials Division, Fuel Cycle Chemistry Division, Reactor Physics Division, Radionuclides and Ionizing Radiation Division, Central Analytical Laboratory, Research Reactor Laboratory, and Technical and Production Division. (J.B.).

11894 (INIS-mf–14470) **Nuclear measurements, techniques and instrumentation industrial applications plasma physics and nuclear fusion, 1980-1993. International Atomic Energy Agency publications.** International Atomic Energy Agency, Vienna

(Austria). Jan 1994. 64p. (SUBJ/CAT–1993/NMPP.). Order Number DE95623591. Source: OSTI; NTIS (US Sales Only); INIS.

This catalogue lists all sales publications of the International Atomic Energy Agency dealing with Nuclear Measurements, Techniques and Instrumentation, with Industrial Applications (of Nuclear Physics and Engineering), and with Plasma Physics and Nuclear Fusion, issued during the period 1980-1993. Most publications are in English. Proceedings of conferences, symposia, and panels of experts may contain some papers in other languages (French, Russian, or Spanish), but all papers have abstracts in English. Price quotes are in Austrian Schillings, do not include local taxes, and are subject to change without notice. Contents cover the three main categories of (I) Nuclear Measurements, Techniques and Instrumentation (Physics, Chemistry, Dosimetry Techniques, Nuclear Analytical Techniques, Research Reactors and Particle Accelerator Applications, Nuclear Data); (ii) Industrial Applications (Radiation Processing, Radiometry, Tracers); and (iii) Plasma Physics and Nuclear Fusion.

11895 (INP–1536) **Annual report from realization of Central Program of Basic Studies no. 01.09 "Studies of elementary particles and nuclear processes" for the year 1990.** Wojciechowski, H. Institute of Nuclear Physics, Cracow (Poland). 1991. 137p. (In Polish). Order Number DE95619159. Source: OSTI; NTIS; INIS.

The results of program realization in 1990 are summed up. The proposals of utilization of obtained results are given together with the bibliography of published papers. The program statistical data are also presented.

11896 (INP–1537) **Report from realization of Central Program of Basic Studies no 01.09 "Studies of elementary particles and nuclear processes" for the year 1986-1990.** Wojciechowski, H. Institute of Nuclear Physics, Cracow (Poland). 1991. 172p. (In Polish). Order Number DE95619160. Source: OSTI; NTIS; INIS.

A general description of the program is given. The results of program realization are presented in detail. Its main effects are summed up.

11897 (JAERI-Review–94-009) **Reactor engineering department annual report. April 1, 1993-March 31, 1994.** Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 342p. Order Number DE95747892. Source: OSTI; NTIS; INIS.

This report summarizes the research and development activities in the Department of Reactor Engineering during the fiscal year of 1993 (April 1, 1993-March 31, 1994). The major Department's programs promoted in the year are the design activities of advanced reactor system and development of a high energy proton linear accelerator for the engineering applications including TRU incineration. Other major tasks of the Department are various basic researches on the nuclear data and group constants, the developments of theoretical methods and codes, the reactor physics experiments and their analyses, fusion neutronics, radiation shielding, reactor instrumentation, reactor control/diagnosis, thermohydraulics and technology developments related to the reactor engineering facilities, the accelerator facilities and the thermal-hydraulic facilities. The cooperative works to JAERI's major projects such as the high temperature gas cooled reactor or the fusion reactor and to PNC's fast reactor project were also progressed. The activities of the research committees organized by the Department are also summarized in this report. (author).

11898 (KURRI-TR–395) **Summary reports of activities under visiting research program (1994).** Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Sep 1994. 82p. (In Japanese). Order Number DE95747919. Source: OSTI; NTIS; INIS.

This summary reports of activities under visiting research program in the Research Reactor Institute, Kyoto University, in fiscal year 1993 are included. In this report, 126 summaries of researches using the Kyoto University Reactor (KUR) and 12 summaries of the researches using the Kyoto University Critical Assembly (KUCA) are collected. (J.P.N.).

11899 (LA-UR–93-3831-Rev.) **Integrated formal operations plan.** Cort, G.; Dearholt, W.; Donahue, S.; Frank, J.; Perkins, B.; Tyler, R.; Wrye, J. Los Alamos National Lab., NM (United States). 5 Jan 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005581. Source: OSTI; NTIS; GPO Dep.

The concept of formal operations (that is, a collection of business practices to assure effective, accountable operations) has vexed the Laboratory for many years. To date most attempts at developing such programs have been based upon rigid, compliance-based interpretations of a veritable mountain of Department of Energy (DOE) orders, directives, notices, and standards. These DOE dictates seldom take the broad view but focus on highly specialized programs isolated from the overall context of formal operations. The result is a confusing array of specific, and often contradictory, requirements that produce a patchwork of overlapping niche programs. This unnecessary duplication wastes precious resources, dramatically increases the complexity of our work processes, and communicates a sense of confusion to our customers and regulators. Coupled with the artificial divisions that have historically existed among the Laboratory's formal operations organizations (quality assurance, configuration management, records management, training, etc.), this approach has produced layers of increasingly vague and complex formal operations plans, each of which interprets its parent and adds additional requirements of its own. Organizational gridlock ensues whenever an activity attempts to implement these bureaucratic monstrosities. The integrated formal operations plan presented is to establish a set of requirements that must be met by an integrated formal operations program, assign responsibilities for implementation and operation of the program, and specify criteria against which the performance of the program will be measured. The accountable line manager specifies the items, processes, and information (the controlled elements) to which the formal operations program specified applies. The formal operations program is implemented using a graded approach based on the level of importance of the various controlled elements and the scope of the activities in which they are involved.

11900 (NUREG–0325-Rev.17) **US Nuclear Regulatory Commission organization charts and functional statements. Revision 17.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Personnel. 3 Oct 1994. 58p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This document is a detailed organizational chart detailing the different staffing and board offices. They include: the commission, the several committees and boards, the commission staff offices, the office of the Inspector General, the executive director for operations and staff offices, and the regional and program offices.

11901 (SAND–94-2581) **Partnering with Sandia National Laboratories through alliances or consortia.** Winchell, B.M. Sandia National Labs., Livermore, CA (United States). Dec 1994. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005532. Source: OSTI; NTIS; GPO Dep.

To better facilitate working with industry, groups of industrial participants, and partners in alliances or consortia, Sandia National Laboratories presents information helpful to those outside groups as to the forms of arrangements that may be used to better facilitate partnering relationships between Sandia National Laboratories and consortia or alliances of outside parties. It is expected that these alliances and consortia will include both large and small for-profit industrial concerns, as well as not-for-profit entities such as universities, institutes, other research facilities, and other nonprofit institutions or consortia containing institutions. The intent of this report is to provide such outside groups with information that will facilitate rapid interactions with Sandia National Laboratories through some of these forms of business which will be discussed in this report. These are not the only approaches to facilitating business interactions with Sandia National Laboratories and it is not intended that this report be legal advice or required approaches to doing business with Sandia National Laboratories. The intent of this report is merely to suggest ways in which Sandia National Laboratories can work with outside parties in the most expeditious manner.

11902 (SINS–2115/B) **Andrzej Soltan 1897-1959. Bio-bibliographic monograph.** Plucinska, H. Soltan Inst. for Nuclear

Studies, Otwock-Swierk (Poland). 1991. 102p. (In Polish). Order Number DE95619161. Source: OSTI; NTIS; INIS.

Report contains the biography of professor Andrzej Soltan the first director of the Institute of Nuclear Research at Swierk, the description of his scientific and organizational activity as well as the bibliography of his papers. 73 refs.

11903 (SSI–94-10) **Project Radiation Protection - East.** Bennerstedt, T. (Tekno Telje (Sweden)); Snihs, J.O.; Sundewall, H. Swedish Radiation Protection Inst., Stockholm (Sweden). 30 Sep 1994. 62p. (In Swedish). Order Number DE95620490. Source: OSTI; NTIS; INIS.

The Swedish Government has allocated SEK 37.1 million for cooperation projects in radiation protection with countries in Central and Eastern Europe, particularly the Baltic states (Estonia, Latvia, Lithuania) and Russia. The Swedish Radiation Protection Inst. (SSI) is in charge of this program, which is often referred to as Radiation Protection - East. The general background of this cooperation program, its objectives, practical organization of the work etc. have been presented in the following reports: SSI Report No.93-08: Projekt Straalskydd Oest - Laegesrapport (March 1993); SSI Report No.93-29: Swedish Cooperation Program for Radiation Protection in Eastern and Central Europe (November 1993). The present report summarizes the work carried out up to and including September 1994. The more than 70 cooperation projects have been divided into the following categories: Upgrading of national authorities; Emergency preparedness, early warning; Nuclear power and research reactors; Instrumentation; Decommissioning, waste, environmental control; General radiation protection; Other projects; Project management and administrative support. Project criteria and a simple program for quality assurance and follow-up are presented briefly. A status report, including an economic overview, is given for all ongoing or already finished projects, together with future plans and a suggested budget for the next fiscal year.

11904 (WHC-SD-WM-PMP–017) **Project management plan for Contract Management Information System (CONTRACT).** Severud, K.J. Westinghouse Hanford Co., Richland, WA (United States). 27 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006901. Source: OSTI; NTIS; GPO Dep.

The office of the Vice President of A/E Construction for ICF Kaiser has requested that OSHA compliance statistics be made available to management for companies subcontracting to the ICF Kaiser Company. In addition, a need to better manage contract administrative data for the Contracts Administration and the Construction Management Projects organizations has been identified. The Contract Management Information System is being developed to achieve these objectives. This document provides a Project Management Plan for development of the Contract Management Administration System (CONTRACT) by Design Services DAD/CAE Support. The Project Management Plan describes the project work breakdown structure, safety and quality considerations, with associated cost, schedule and project management information. The CONTRACT System is intended to aid the ICF Kaiser divisions with tracking of A/E subcontractor information to include general contract administration information used by the Contracts Administration organization, contract and safety performance data used by the Construction Management Projects and office of the organization and Vice President of A/E Construction.

11905 (ANL/MCS-TM–199) **Users guide for the ANL IBM SPx.** Gropp, W.; Lusk, E. Argonne National Lab., IL (United States). Dec 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005049. Source: OSTI; NTIS; GPO Dep.

This guide presents the features of the IBM SPx installed in the Mathematics and Computer Science Division at Argonne National Laboratory. The guide describes the available hardware and software, access policies, and hints for using the system productively.

11906 (CONF-9004159–10) **A 2D electrostatic PIC code for the Mark III Hypercube.** Ferraro, R.D. (Jet Propulsion Lab., Pasadena, CA (United States)); Liewer, P.C.; Decyk, V.K. Jet Propulsion Lab., Pasadena, CA (United States). [1990]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract FG03-84ER53173. NAS7-918. From 5. distributed memory computing conference; Charleston, SC (United States); 8-12 Apr 1990. Order Number DE95005479. Source: OSTI; NTIS; GPO Dep.

We have implemented a 2D electrostastic plasma particle in cell (PIC) simulation code on the Caltech/JPL Mark IIIfp Hypercube. The code simulates plasma effects by evolving in time the trajectories of thousands to millions of charged particles subject to their self-consistent fields. Each particle's position and velocity is advanced in time using a leap frog method for integrating Newton's equations of motion in electric and magnetic fields. The electric field due to these moving charged particles is calculated on a spatial grid at each time by solving Poisson's equation in Fourier space. These two tasks represent the largest part of the computation. To obtain efficient operation on a distributed memory parallel computer, we are using the General Concurrent PIC (GCPIC) algorithm previously developed for a 1D parallel PIC code.

11907 (DES–184e) **CLAIRE, an event-driven simulation tool for testing software.** Raguideau, J.; Schoen, D.; Henry, J.Y.; Boulc'h, J. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. 11p. (CONF-9406298–: Specialists' meeting on advanced control and instrumentation systems in nuclear power plants: design, verification and validation, Espoo (Finland), 20-23 Jun 1994). Order Number DE95619145. Source: OSTI; NTIS (US Sales Only); INIS.

CLAIRE is a software tool created to perform validations on executable codes or on specifications of distributed real-time applications for nuclear safety. CLAIRE can be used both to verify the safety properties by modelling the specifications, and also to validate the final code by simulating the behaviour of its equipment and software interfaces. It can be used to observe and provide dynamic control of the simulation process, and also to record changes to the simulated data for off-line analysis. (R.P.).

11908 (DOE/ER/25136–2) **Newton iterative methods for large scale nonlinear systems. Final report, August 1992–July 1994.** Walker, H.F.; Turner, K. Utah State Univ., Logan, UT (United States). Dept. of Mathematics and Statistics. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER25136. Order Number DE95007067. Source: OSTI; NTIS; GPO Dep.

Newton iterative methods, also known as truncated Newton methods, are implementations of Newton's method in which an iterative linear solver is used to solve approximately the linear systems that characterize Newton steps. These methods are particularly appropriate for large-scale problems in which iterative linear algebra methods are preferred. They are currently used in many important scientific applications, including many of major industrial importance. In addition to their effectiveness on important problems, these methods also offer a nonlinear 'framework' within which to transfer to the nonlinear setting any advances in linear system solving, such as new iterative methods for nonsymmetric linear systems, new preconditioning techniques, or new algorithms that exploit advanced machine architectures.

11909 (ENEA-RT-ERG–94-09) **Real, hyperbolic and complex quadratic maps.** Catoni, F. (ENEA, Casaccia (Italy). Centro Ricerche Energia); Giuli, G.; Pisacane, F. ENEA, Casaccia (Italy).

Centro Ricerche Energia. Sep 1994. 14p. (In Italian). (RT/ERG–94-09). Order Number DE95749685. Source: OSTI; NTIS (US Sales Only).

The quadratic maps are extensively studied as the simplest example of mathematical chaos. Here it has been showed how, by hypercomplex number systems, called hyperbolic, could be possible to link up real maps, to complex maps.

11910 (ENEA-RT-ERG–94-18) **Hypercomplex numbers, functions of hypercomplex variable and physical fields.** Catoni, F. (ENEA, Casaccia (Italy). Area Energetica). ENEA, Casaccia (Italy). Area Energetica. Sep 1994. 31p. (In Italian). (RT/ERG–94-18). Order Number DE95749680. Source: OSTI; NTIS (US Sales Only).

The formal use of complex variable (special relativity), the use of complex functions (quantum mechanics, Fourier transform, etc.), the N dimensional space complessification are well know to physicists. The hypercomplex numbers are seldom considered and, when this is done, the non commutative Hamilton quaternions are generally used. In this report is shown how commutative hypercomplex numbers can be an extension of complex variable and important applications are proposed. The basic concepts of the algebra of hypercomplex numbers and their relation with continuos finite Lie groups are shown. The conditions that allow to extend the function theory of complex variable to hypercomplex numbers systems and to link them to infinite Lie group and physical fields are explained. To conclude all the systems up to 4 elements are given.

11911 (ENEA-RT-INN–94-01) **Linefit 2.0 a software for reduction of spectroscopical data.** D'Amato, F. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Ciucci, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 33p. (RT/INN–94-01). Order Number DE95749684. Source: OSTI; NTIS (US Sales Only).

It is realized a dedicated software package for the analysis of spectroscopic data. Compared to the few commercial packages available, it is easy to use and flexible, in the sense that it can be used in several kinds of experimental conditions. Moreover, the approximation for Voight lineshapes and the routine for X^2minimization that it is chosen proved to be reliable.

11912 (ENEA-RT-INN–94-13) **Using lapack routines in nag fortran library: Experiences and comparisons.** Orsi, R. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione); Vaccari, M.; Ventura, A.; Visparelli, D.; Zucchini, A.; Frontini, V. ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. Apr 1994. 23p. (CONF-9404240–1: NAGUA'94 conference, Oxford (United Kingdom), 14-15 Apr 1994; RT/INN–94-13). Order Number DE95749728. Source: OSTI; NTIS (US Sales Only).

Two computer codes using LAPACK Fortran routines as inserted in the NAG Fortran Library version 15 are presented. The first code is a Finite element method Fortran code for the analysis of geometrically nonlinear thin shells, the second one is an improved version of a code based on an algebraic scattering theory for heavy ions. Use and choice of NAG routines is discussed, with reference to computing times, memory occupation and accuracy.

11913 (ENEA-RT-INN–94-36) **Generalized Bessel functions and Kapteyn series.** Dattoli, G. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Torre, A.; Lorenzutta, S.; Maino, G. ENEA, Casaccia (Italy). Area Energia e Innovazione. Apr 1994. 21p. (RT/INN–94-36). Order Number DE95749676. Source: OSTI; NTIS (US Sales Only).

Kapteyn series are introduced for generalized Bessel functions in full analogy with ordinary Bessel functions. Apart from the relevance that Kapteyn series have in astronomical problems and in electromagnetic radiation theory, interest in this type of series is justified by the possibility of expanding analytic functions of a complex variable in series of Bessel functions with specific features. Accordingly, in this paper, it is shown that it is possible to obtain expansions of m-variable analytic functions in series of GBF's, which reproduce the structure of Kapteyn series of ordinary Bessel functions. The possible field of applications is also suggested.

11914 (ENEA-RT-INN–94-39) **Phase-space formalism: Generalized harmonic oscillator functions.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Torre, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Oct 1994. 28p. (RT/INN–94-39). Order Number DE95749670. Source: OSTI; NTIS (US Sales Only).

The report discusses the mathematical properties of the phase-space harmonic oscillator orthogonal functions. It introduces the relevant creation-annihilation operators and points out the existence of generalized uncertainty relations of the Heisenberg type. It defines coherent phase-space states and shows that they are generalized minimum uncertainty states. It applies the developed methods to the analysis of classical and quantum harmonic oscillators, and, within such a framework, it proposes an operator formalism allowing the possibility of exploiting Heisenberg like equations for both classical and quantum problems.

11915 (ENEA-RT-INN–94-41) **First experiments of parallel application in ENEA (Italian National Agency for New Technologies, Energy and the Environment): Neural networks.** Taraglio, S. (ENEA, Casaccia (Italy). Area Energia e Innovazione). ENEA, Casaccia (Italy). Area Energia e Innovazione. Nov 1994. 14p. (In Italian). (RT/INN–94-41). Order Number DE95749672. Source: OSTI; NTIS (US Sales Only).

In this report is presented a first experiment of a parallel application implemented on a Quadrics supercomputer in ENEA (Italian National Agency for New Technologies, Energy and the Environment). On this SIMD parallel machine it has been realized a learning algorithm for multilayer perceptrons, the so called back-propagation. This feasibility study has been aimed towards the solving of the problem of the logical exclusive or (XOR). The main reason being the nonlinear separability of such a problem, i.e. the need for a hidden layer in the neural architecture. The parallel algorithm is presented together with its performances under different optimizing techniques on Quadrics.

11916 (ENEA-RT-INN–94-43) **Generating function method and properties of relativistic hermite polynomials.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Torre, A.; Lorenzutta, S.; Maino, G. ENEA, Casaccia (Italy). Area Energia e Innovazione. Jun 1994. 18p. (RT/INN–94-43). Order Number DE95749674. Source: OSTI; NTIS (US Sales Only).

It is shown that the generating function of the relativistic Hermite polynomials satisfies an evolution-type equation, which can be solved using straightforward operational techniques. The method developed allows the derivation of the properties of this class of polynomials using almost elementary tools and indicates, in an obvious way, how they can be expressed in terms of Gegenbauer polynomials.

11917 (ESTSC–000747IBMPC00) **HATCHES. A Thermodynamic Database and Management System Reprint Radiochemica Acta.** Ewart, F.T. (Harwell Laboratory, Oxfordshire OX11 ORa, (United Kingdom)); Cross, J.E. OECD Nuclear Energy Agency, 75 - Paris (France). 1 Dec 1992. Sponsored by National Endowment for the Arts, Washington, DC (United States). Source: ESTSC.

Description: IBM PC; Aston-Tate DBase (III plus softwDBASE-III; 1 3.5 Diskette.

HATCHES is a collection of data for use in radiochemical modelling work. The data base includes thermodynamic data (the log formation constant and the enthalpy of formation for the chemical species) for the actinides U, Th, Pu, Np, Am AND cM and for fission products including Cs, Ru, Tc, and Sr.

11918 (ESTSC–000755IBMPC00) **LWRARC. Decay Heat Rate Calculations for Light Water Reactor Fuel Assembly.** Bowman, S.M. (Oak Ridge National Lab., TN (United States)); Hermann, O.W. Oak Ridge National Lab., TN (United States). 1 Jul 1994. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Source: ESTSC.

Description: IBM PC; MS-DOS; Microsoft BASIC 7.1 (90%), Assembler (10%); 1 5.25 Diskette.

LWRARC calculates spent fuel decay heat generation rates for standard pressurized water reactor (PWR) and boiling water reactor (BWR) fuel assembly designs for cooling times between 1 and 110 years.

11919 (ESTSC–000780C660000) **NEPTUNE. Bound State Wave Functions in Nuclei.** Tamura, T. (University of Texas, Austin, TX (United States)). Texas Univ., Austin, TX (United States). Center for Nuclear Studies. 27 May 1968. Sponsored by USDOE, Washington, DC (United States). (NESC–9875). Source: ESTSC.

Description: CDC6600; SCOPE; FORTRAN IV; 1 Mag Tape.

NEPTUNE solves Schroedinger equations for wave functions of nucleons bound in a generalized Saxon potential. The Schroedinger equation considered is either a single, or a set of coupled, differential equations of second order, which NEPTUNE solves as an eigenvalue problem. The most frequent use of NEPTUNE is in obtaining the form factors to be used in various DWBA calculations. NEPTUNE can be used in the following calculations: (1) single-particle shell model, in which NEPTUNE calculates the single particle wave functions of a proton or neutron bound in a spherically symmetric Saxon potential; (2) Lane model, in which the Lane interaction is added to a spherically symmetric Saxon potential; (3) core excitation model, in which the core of an odd-A nucleus is spherical but can vibrate easily; and (4) Saxon-Nilsson model, in which the Saxon potential is deformed into a spheroid.

11920 (ESTSC–000784IB48600) **PC-MARKAL (MUSS). Energy Systems Optimization Model and User's Support System.** Goldstein, G.A. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). 1 Apr 1991. Sponsored by Environmental Protection Agency, Washington, DC (United States). Source: ESTSC.

Description: IBM PC 486; DOS 3.3 or higher; OMNI (PC-MARKAL), Clipper Summer 87 (MUSS); 3 3.5 Diskettes. PC-MARKAL is written in the OMNI modeling language. The language is a proprietary product of Haverly Systems Inc. OMNI must be installed to execute the PC-MARKAL matrix generator and report writer code. The model is solved using a commercially available linear programming optimization model that is interfaced with OMNI. The interface is necessary in order for the PC-MARKAL reports to be produced from the solution. HSLP, provided with OMNI by Haverly Systems Inc., and XPRESS-MP for DASH Associated are the most often used solvers. PC-MARKAL requires that enough, depending upon model size, expanded memory be available. The modeling software and utilities require about 3Mb of hard disk space. Temporary files created during model execution and solving can require up to 10Mb of free disk space.

PC-MARKAL is an energy systems optimization model used to examine alternate futures for development of energy systems dpending upon environmental and/or policy constraints. The model is generally used to identify and prioritize the most cost-effective options to realizing desired policy goals. It guides decision makers at the national, regional, and community level. MUSS is a database management system employing standard user interface techniques (e.g. pop-up menus, on-line help, dialog boxes) to oversee all aspects of working with the PC-MARKAL energy systems optimization model. It manages the input data, control model execution, and accepts reporting tables back on-line for post optimization analysis of the results.

11921 (ESTSC–000791C760000) **SLAB-LLNL. Steady State Dense Gas Dispersion.** Ermak, D.L. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 13 Mar 1984. Sponsored by USDOE, Washington, DC (United States). (NESC–9657). Source: ESTSC.

Description: CDC7600; NOS; LRLTRAN; 1 Mag Tape. SLAB-LLNL calls several LLNL system and plotting routines; these are not included.

SLAB-LLNL is a steady-state one-dimensional program which calculates the atmospheric dispersion of a heavier than air gas that is continuously released at ground level. The model is based on the steady-state crosswind-averaged conservation equations of species, mass, energy, and momentum. It uses the air entrainment concept to account for the turbulent mixing of the gas cloud with the surrounding atmosphere and similarity profiles to determine the crosswind dependence.

11922 (IFVE-ORI–92-99) **Universal geometrical module for MARS program.** Talanov, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 8p. (In Russian). Order Number DE95619146. Source: OSTI; NTIS (US Sales Only); INIS.

Geometrical program module for modeling hadron and electromagnetic cascades, which accomplishes comparison of physical coordinates with the particle current state of one of the auxilliary cells, is described. The whole medium wherein the particles are tracked, is divided into a certain number of auxilliary cells. The identification algorithm of the cell, through which the particle trajectory passes, is considered in detail. The described algorithm for cell identification was developed for the MARS program and realized in form of a set of subprograms written in the FORTRAN language. 4 refs., 1 tab.

11923 (INIS-AR–094) **Pressurizer model for Embalse nuclear power plant.** Parkansky, D.G.; Bedrossian, G.C. Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria. 1993. 4p. (In Spanish). (CONF-9311167–: 21. meeting of the Argentine Association of Nuclear Technology, Mar del Plata (Argentina), 8-12 Nov 1993). Order Number DE95623576. Source: OSTI; NTIS (US Sales Only); INIS.

Pre-conference paper.

Since the models normally used for he simulation of eventual accidents at the Embalse nuclear power plant with the FIREBIRD III code did not work satisfactorily when the pressurizer becomes empty of liquid, a new model was developed. This report presents the governing equations as well as the calculation technique, for which a computer program was made. An example of application is also presented. The results show that this new model can easily solve the problem of lack of liquid in the pressurizer, as it lets the fluid enter and exit freely, according to the pressure transient at the reactor outlet headers. (author).

11925 (INIS-AR–108) **Application of a spatial modal kinetic model for determination of control rod worths.** Gomez, A.; Waldman, R.M. Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria. 1993. 3p. (In Spanish). (CONF-9311167–: 21. meeting of the Argentine Association of Nuclear Technology, Mar del Plata (Argentina), 8-12 Nov 1993). Order Number DE95623578. Source: OSTI; NTIS (US Sales Only); INIS.

Pre-conference paper.

A high-precision rod drop method based on a modal kinetic model, with low dependence on detector location, is proposed to measure the reactivity worth of control rods. This value is obtained from data adjustment for the delayed evolution. It is necessary to maintain the experimental data fluctuation in a small value so that the error of the control rod worth should not be large. A model was developed in order to relate the fluctuation with some parameters which may be modified in the measuring process. The method was applied in the RA-6 reactor to measure control rod worth. For practical purpose it was found that the method can be applied to 15 dollars and it does not depend on relative detector and control rod locations, as the method based on the Point Reactor Model does. (author). 2 refs.

11926 (INIS-mf–14445, [pp. 14]) **Low cost nuclear data printer.** Punnachiya, S. (Chulalongkorn Univ., Bangkok (Thailand). Dept. of Nuclear Technology); Aungkultewaraksa, S.; Pengphol, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988.

440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The data printer is essential for nuclear radiation measuring system. A low cost nuclear data printer is developed from an electronic printing calculator. It can transfer the counting data from scaler and printout. The basic concept is that the BCD data is transferred and converted to decimal data sequentially by the interfacing circuit. After the counting time is ended, each digit is transferred to the printing calculator by data bus, digit by digit, until all the data are transferred and printed out. The low cost nuclear data printer consists of a CASIO model HR-8 electronic printing calculator and a printer interface model either NT 2602 or NT 2603 which are designed for printing out 6 digit data from the counter/timer CANBERRA model 1772. In this research the NT 2602 interface is designed only to transfer and printing out data. While the NT 2603 interface is designed to transfer, print out and average data. The NT 2603 can average from 2 to 9 sets of counting data. This data interfacing technique can be applied to work with all scientific instruments having readout as digital display and all kinds of electronic printing calculator.

11927 (INIS-mf–14445, pp. B-2, 1-9) **Computerized analysis of gamma-ray spectrum obtained with semiconductor detector.** Wanabongse, P. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Technique in computerized analysis of gamma-ray spectrum begins with the smoothing of spectral date and the calculation of significance of the second difference. The results lead directly to the peak locations and roughly estimate the peak shapes. In the following step the test is made to accept or reject a peak. Technique is representing date of the photopeak and its vicinity uses composite function consists of Gaussian, exponential and polynomial functions. Iterative least squares analysis is employed in the determining of the parameters.

11928 (INIS-mf–14445, pp. B-3, 1-22) **The design of database for analysis of data from multichannel analyzer.** Rakumphol, S.; Nouchpramool, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The use of database management system in analyzing data from multichannel analyzer (MCA) are studied and designed to bring up various types of data from MCA to microcomputer in neutron activation analysis work. RS-232 interface used in transmitting and receiving signals from MCA to microcomputer by asynchronous communication was studied. The software (PC-talk) used in receiving data from MCA and save data file on diskette in microcomputer was studied. Then the developing database program was used to analyze types of element, determine the content of elements and also report results.

Source: OSTI; NTIS (US Sales Only); INIS.

The VPI Program Package designed for medium-size computers has been adapted to IBM PC type microcomputer. The package consists of 6 independent modules, i.e., FARCON, SLOCON, DISFAC, ODOG, ODMUG and FBURN. Operating system programs to manage all modules and to help inexperienced users have been added, especially for the input process which is now totally interactive. Automatic link between some modules, to transfer input-output data between them, called the VPI Link Version, has also been developed. The new version is able to calculate burnup or depletion in the successive cycles without the necessity to prepare new input data as in the original version. The results from IBM PC/XT are closed to that of the original version. The time required for each module varies from a minimum of 15 seconds up to 9 minutes for IBM PC/XT with 4.7 MHz microprocessor, and from 13 seconds up to 1 minute with 7 MHz microprocessor.

The neutron shielding analysis and design program was developed for microcomputer, by modifying the SABINE-3 shielding code which was written for mainframe computers. The program is based on removal-diffusion method and was modified from the SABINE-3 code. The program could be used to calculate shielding for nuclear reactors and neutron source. The accuracy of the program was tested by determining the neutron and gamma dose rate of a test case of Cf-252 source. The results were nearly identical with those obtained from original SABINE-3 which was computed on PRIME 9750 super minicomputer. Computing time was about 65 minutes.

11931 (JINR-E–2-94-337) **On Application of Wavelet Analysis to Separation of Secondary Particles from Nucleus-Nucleus Interactions.** Afanas'ev, S.V.; Altajskij, M.V.; Zhestkov, Yu.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy; Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 14p. Order Number DE95623572. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuovo Cimento. A.

We apply wavelet analysis for separation of secondary particle from different channels of d + Au → ... reaction. Using the data obtained in the experiments at Nuclotron (Dubna) in March 1994 at deuteron momentum of 3.8 GeV/c, we found 4 different regions in the time-of-flight vs energy loss plot. 17 refs., 5 figs.

11932 (JINR-E–2-94-352) **Physics of the CEM92M Code.** Mashnik, S.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 14p. Order Number DE95623579. Source: OSTI; NTIS (US Sales Only); INIS.

Invited talk presented to the NEA Nuclear Science Committee Meeting on Intermediate Energy Nuclear Data, Nuclear Energy Agency Headquarters, Issy-les-Moulineaux, Paris, May 30 - Jun 1, 1994.

The code CEM92M is intended for calculation of reaction, elastic, fission and total cross sections; nuclear fissilities; excitation functions; nuclide distributions; energy and angular spectra; double differential cross sections; mean multiplicities, mean energies and production cross sections for n, p, d, t, ^{3} He, ^{4} He, π^-, π^0 and π+ emitted in nucleon-and pion-induced reactions using the Cascade-Exciton Model (CEM) of nuclear reactions. The main assumptions of the CEM are given. A large variety of nucleon-, pion- and γ-induced reactions in the bombarding energy range of 0-3000 MeV have been analyzed and evaluated with it. It is shown that the CEM adequately describes nuclear reactions at intermediate energies, has one of the best predictive powers as compared to other available modern models and may be used for evaluation of medium energy nuclear data for science and applications. Further development and improvement of the code CEM92M are discussed. 21 refs., 7 figs.

11933 (JINR-R–10-94-363) **A Choice of Input Variables for a Multilayer Perceptron.** Bonyushkina, A.Yu.; Zrelov, P.V.; Ivanov, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1994. 12p. (In Russian). Order Number DE95623573. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Computer Physics Communications.

In the paper some aspects of multilayer perceptron (MLP) application to the problem of classifying the events presented by empirical samples of a finite volume are considered. The results of the MLP learning for various forms of the input data are analyzed and the reasons leading to the effect of an instantaneous learning of the MLP and rise of the neural network are investigated for the case when the input data are presented in a form of variational series. The problem of hidden layer neuron reduction without raising the recognition error is discussed. (author). 13 refs., 6 figs., 1 tab.

11934 (KEK–94-1) **A modeling of an accelerator using the object oriented technology.** Ohmi, K. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Apr 1994. 17p. (In Japanese). Order Number DE95747975. Source: OSTI; NTIS; INIS.

It is proposed to construct a hypothetic accelerator on a computer using object orientation, by giving thought to the control system in the Photon Factory. As the language, the C++ which is appearing widely in world is employed. What is the object, that is, the accelerator which is present before us now (Photon Factory) like, what data composition it has, and how it is operated are reconfirmed, and the works of fitting those to the class of C++ are required. In this report, three hypothetical accelerator models that may help these works. Object orientation is to write programs by making objects the main bodies. In this case, an object, accelerator, is expressed on a program, and is called hypothetic accelerator. By the access to the hypothetic accelerator, it is aimed at to operate an actual accelerator. An accelerator has many data. The selection of the data necessary for the control is the first step. Thereafter, giving and taking of the data are considered. The objectifying as a system is accompanied by ambiguity, and requires thought. In order to observe the features of object-oriented program, a simple model 'hypothetic PF-ring model 1', a grouped, organization chart-like model 'hypothetic PF-ring model 2' and 'hypothetic PF-ring model 3' in which an object is arranged in a ring using the concept of linear list are introduced. (K.I.).

11935 (LA-UR–94-2848) **The comparison of P_1 and simplified P_2 synthetic acceleration for iterative methods in transport solutions.** Noh, T. (Los Alamos National Lab., NM (United States)); Miller, W.F. Jr. Los Alamos National Lab., NM (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–1: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE94018306. Source: OSTI; NTIS; GPO Dep.

Using an operator form of a synthetic acceleration method, we derive the P_1- and a new second-moment P_2-acceleration schemes. We analyze the convergence rate of each scheme by Performing a Fourier analysis. The second-moment P_2-acceleration outperforms an earlier third-moment P_2-acceleration method by Miller and Larsen. However, it is still less efficient than P_1-acceleration (diffusion synthetic acceleration: DSA). These results confirm that one cannot simply assume that replacement of the DSA method with a higher order operator will lead to a smaller spectral radius. We get similar results for the P_1- and simplified P_2-acceleration in two-dimensional x-y geometry.

11936 (LA-UR–94-3152) **Designing a stencil compiler for the Connection Machine model CM-5.** Brickner, R.G. (Los Alamos National Lab., NM (United States)); Holian, K.; Thiagarajan, B.; Johnsson, S.L. Los Alamos National Lab., NM (United States). [1994]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006861. Source: OSTI; NTIS; GPO Dep.

In this paper the authors present the design of a stencil compiler for the Connection Machine system CM-5. The stencil compiler will optimize the data motion between processing nodes, minimize the data motion within a node, and minimize the data motion between registers and local memory in a node. The compiler will natively support two-dimensional stencils, but stencils in three dimensions will be automatically decomposed. Lower dimensional stencils are treated as degenerate stencils. The compiler will be integrated as part of the CM Fortran programming system. Much of the compiler code will be adapted from the CM-2/200 stencil compiler, which is part of CMSSL (the Connection Machine Scientific Software Library) Release 3.1 for the CM-2/200, and the compiler will be available as part of the Connection Machine Scientific Software Library (CMSSL) for the CM-5. In addition to setting down design considerations, they report on the implementation status of the stencil compiler. In particular, they discuss optimization strategies and status of code conversion from CM-2/200 to CM-5 architecture, and report on the measured performance of prototype target code which the compiler will generate.

11937 (LA-UR–94-3378) **Authoring tool evaluation.** Wilson, A.L.; Klenk, K.S.; Coday, A.C.; McGee, J.P.; Rivenburgh, R.R.; Gonzales, D.M.; Mniszewski, S.M. Los Alamos National Lab., NM (United States). 15 Sep 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006450. Source: OSTI; NTIS; GPO Dep.

This paper discusses and evaluates a number of authoring tools currently on the market. The tools evaluated are Visix Galaxy, NeuronData Open Interface Elements, Sybase Gain Momentum, XVT Power++, Aimtech IconAuthor, Liant C++/Views, and Inmark Technology zApp. Also discussed is the LIST project and how this evaluation is being used to fit an authoring tool to the project.

11938 (LA-UR–94-3994) **Gigabit LAN issues: HIPPI, Fibre Channel, or ATM?.** Tolmie, D.E. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505116–1: International conference and exhibition on high-performance computing and networking, Milan (Italy), 3-5 May 1995). Order Number DE95003673. Source: OSTI; NTIS; GPO Dep.

Computer networks that operate in the gigabit per second speed range are becoming very important for interconnecting supercomputers, clusters of workstations, and other high end equipment. HIPPI is the current interface of choice, while Fibre Channel and ATM are emerging standards. These systems are examined as to their backgrounds, advantages, and shortcomings.

11939 (LA-UR–94-4035) **Nonlinear difference approximations for evolutionary PDEs.** Jones, D.A.; Margolin, L.G.; Poje, A.C. Los Alamos National Lab., NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409241–6: NEEDS '94, Los Alamos, NM (United States), 12-16 Sep 1994). Order Number DE95005260. Source: OSTI; NTIS; GPO Dep.

The authors describe a procedure to improve both the accuracy and computational efficiency of finite difference schemes used to simulate nonlinear PDEs. The underlying idea is that of enslaving, which is the estimation of the small unresolved scales in terms of the larger resolved scales. They discuss details of the procedure and illustrate them in the context of the forced Burgers' equation in one dimension. They present computational examples that demonstrate the predicted increases in accuracy and efficiency.

11940 (LA-UR–94-4127) **Converting multiple OC-3c ATM streams to HIPPI to drive an HDTV frame buffer from a workstation cluster.** Tolmie, D.E.; Dornhoff, A.G.; DuBois, A.J. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950484–1: IPPS 95: parallel processing symposium, Santa Barbara, CA (United States), 25-28 Apr 1995). Order Number DE95003638. Source: OSTI; NTIS; GPO Dep.

A group of eight Digital Equipment Corporation Alpha workstations is interconnected with ATM to form a cluster with supercomputer power. For output, each workstation drives a single "tile" on an 8-tile high-resolution frame buffer. A special purpose adapter is used to convert the workstation's ATM format to the frame buffer's HIPPI format. This paper discusses the rationale behind the workstation farm, and then describes the visualization output path in detail. To provide the system quickly, special emphasis was placed on making the design as simple as possible. The design choices are examined, and the resultant system is described.

11941 (LA-UR–95-22) **Generalized CNF satisfiability, local reductions and complexity of succinctly specified problems.** Marathe, M.V.; Hunt, H.B. III; Stearns, R.E.; Radhakrishnan, V. Los

Alamos National Lab., NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505175–1: 10. IEEE annual conference on structures in complexity theory, Las Vegas, NV (United States), May 1995). Order Number DE95006343. Source: OSTI; NTIS; GPO Dep.

We, study the complexity and efficient approximability of various decision, counting and optimization problems when instances are specified using (1) the 1-dimensional finite periodic narrow specifications of Wanke, (2) the 2-way infinite 1-dimensional narrow periodic (sometimes called dynamic) specifications of Karp and Orlin et al., and (3) the hierarchical specification language of Lengauer et al. We outline how generalized CNF satisfiability problems and local reductions can be used to obtain both hardness and easiness results for a number of decision, counting, optimization and approximate optimization problems when instances are specified as in (1), (2) or (3). As corollaries we obtain a number of new PSPACE-hardness and #PSPACE-hardness,9 results and a number of new polynomial time approximation algorithms for natural PSPACE-hard optimization problems. In particular assuming P $\neq$ PSPACE, we characterize completely the complexities of the generalized CNF satisfiability problems SAT(S) of Schaefer [Sc78], when instances are specified as in (1), (2) or (3).

11942 (LA-UR–95-35) **The Sunrise project: An R&D project for a national information infrastructure prototype.** Lee, Juhnyoung. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006340. Source: OSTI; NTIS; GPO Dep.

Sunrise is a Los Alamos National Laboratory (LANL) project started in October 1993. It is intended to a prototype National Information Infrastructure (NII) development project. A main focus of Sunrise is to tie together enabling technologies (networking, object-oriented distributed computing, graphical interfaces, security, multimedia technologies, and data mining technologies) with several specific applications. A diverse set of application areas was chosen to ensure that the solutions developed in the project are as generic as possible. Some of the application areas are materials modeling, medical records and image analysis, transportation simulations, and education. This paper provides a description of Sunrise and a view of the architecture and objectives of this evolving project. The primary objectives of Sunrise are three-fold: (1) To develop common information-enabling tools for advanced scientific research and its applications to industry; (2) To enhance the capabilities of important research programs at the Laboratory; and (3) To define a new way of collaboration between computer science and industrially relevant research.

11943 (PNL-SA–24870) **Multidimensional visualization and browsing for intelligence analysis.** Crow, V. (and others); Pottier, M.; Thomas, J. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409278–2: GVIS '94: graphics and visualization conference, Richland, WA (United States), 8 Sep 1994). Order Number DE95004901. Source: OSTI; NTIS; GPO Dep.

Visualization tools have been invaluable in the process of scientific discovery by providing researchers with insights gained through graphical tools and techniques. At PNL, the Multidimensional Visualization and Advanced Browsing (MVAB) project is extending visualization technology to the problems of intelligence analysis of textual documents by creating spatial representations of textual information. By representing an entire corpus of documents as points in a coordinate space of two or more dimensions, the tools developed by the MVAB team give the analyst the ability to quickly browse the entire document base and determine relationships among documents and publication patterns not readily discernible through traditional lexical means.

11944 (PNL-SA–24993) **Four-dimensional information visualization and analysis system.** Rex, B. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409278–1: GVIS '94: graphics and visualization conference, Richland, WA (United States), 8 Sep 1994). Order Number DE95004935. Source: OSTI; NTIS; GPO Dep.

4DIVAS was conceived for two purposes. The first purpose was to fill the void between the current generation of GIS and high-end, image-only visualization systems. The gap existing between these two systems can be summarized as the limitation of relational database oriented GIS to deal with time and the poor connection in visualization systems to databases of any kind. The second purpose was to permit spatio-temporal modeling and query, functionalities currently underdeveloped in the commercial arena. At the Hanford Site, there are many potential applications for such a system, especially in the monitoring and modeling of potential constituent plumes in the subsurface hydrology over time, among others. In its current form, 4DIVAS exists as a proof-of-concept functional prototype and is therefore more of a technology than a product at this time.

11945 (SAND–94-3082C) **A spectral algorithm for the seriation problem.** Atkins, J.E. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Mathematics); Boman, E.G.; Hendrickson, B. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505145–1: Symposium on theory of computing, Las Vegas, NV (United States), 29 May - 1 jun 1995). Order Number DE95004775. Source: OSTI; NTIS; GPO Dep.

Given a set of objects and a correlation function f reflecting the desire for two items to be near each other, find all sequences π of the items so that correlation preferences are preserved; that is if $\pi(i) < \pi(j) < \pi(k)$ then $f(i,j) \geq f(i,k)$ and $f(j,k) \geq f(i,k)$. This seriation problem has numerous applications, for instance, solving it yields a solution to the consecutive ones problem. We present a spectral algorithm for this problem that has a number of interesting features. Whereas most previous applications of spectral techniques provided bounds or heuristics, our result is an algorithm for a non-trivial combinatorial problem. Our analysis introduces powerful tools from matrix theory to the theoretical computer science community. Also, spectral methods are being applied as heuristics for a variety of sequencing problems and our result helps explain and justify these applications. Although the worst case running time for our approach is not competitive with that of existing methods for well posed problem instances, unlike combinatorial approaches our algorithm remains a credible heuristic for the important cases where there are errors in the data.

11946 (SAND–94-8628C) **XTP as a transport protocol for distributed parallel processing.** Strayer, W.T.; Lewis, M.J.; Cline, R.E. Jr. Sandia National Labs., Livermore, CA (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ; AC04-94AL85000. (CONF-9408119–2: 1994 USENIX conference, Oakland, CA (United States), 1-2 Aug 1994). Order Number DE95004992. Source: OSTI; NTIS; GPO Dep.

The Xpress Transfer Protocol (XTP) is a flexible transport layer protocol designed to provide efficient service without dictating the communication paradigm or the delivery characteristics that quality the paradigm. XTP provides the tools to build communication services appropriate to the application. Current data delivery solutions for many popular cluster computing environments use TCP and UDP. We examine TCP, UDP, and XTP with respect to the communication characteristics typical of parallel applications. We perform measurements of end-to-end latency for several paradigms important to cluster computing. An implementation of XTP is shown to be comparable to TCP in end-to-end latency on preestablished connections, and does better for paradigms where connections must be constructed on the fly.

11947 (SAND–95-0013C) **Fuzzy-algebra uncertainty assessment.** Cooper, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Cooper, D.K. Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941262–1: Winter fuzzy and neural networks conference, Washington, DC (United States), 9 Dec 1994). Order Number DE95005426. Source: OSTI; NTIS; GPO Dep.

A significant number of analytical problems (for example, abnormal-environment safety analysis) depend on data that are partly or mostly subjective. Since fuzzy algebra depends on subjective operands, we have been investigating its applicability to these forms of assessment, particularly for portraying uncertainty in the results of PRA (probabilistic risk analysis) and in risk-analysis-aided decision-making. Since analysis results can be a major contributor to a safety-measure decision process, risk management depends on relating uncertainty to only known (not assumed) information. The uncertainties due to abnormal environments are even more challenging than those in normal-environment safety assessments; and therefore require an even more judicious approach. Fuzzy algebra matches these requirements well. One of the most useful aspects of this work is that we have shown the potential for significant differences (especially in perceived margin relative to a decision threshold) between fuzzy assessment and probabilistic assessment based on subtle factors inherent in the choice of probability distribution models. We have also shown the relation of fuzzy algebra assessment to "bounds" analysis, as well as a description of how analyses can migrate from bounds analysis to fuzzy-algebra analysis, and to probabilistic analysis as information about the process to be analyzed is obtained. Instructive examples are used to illustrate the points.

11948 (SAND–95-0121C) **Browsing the World Wide Web from behind a firewall.** Simons, R.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505162–1: DOE computer security training conference, Milwaukee, WI (United States), 2-4 May 1995). Order Number DE95006805. Source: OSTI; NTIS; GPO Dep.

The World Wide Web provides a unified method of access to various information services on the Internet via a variety of protocols. Mosaic and other browsers give users a graphical interface to the Web that is easier to use and more visually pleasing than any other common Internet information service today. The availability of information via the Web and the number of users accessing it have both grown rapidly in the last year. The interest and investment of commercial firms in this technology suggest that in the near future, access to the Web may become as necessary to doing business as a telephone. This is problematical for organizations that use firewalls to protect their internal networks from the Internet. Allowing all the protocols and types of information found in the Web to pass their firewall will certainly increase the risk of attack by hackers on the Internet. But not allowing access to the Web could be even more dangerous, as frustrated users of the internal network are either unable to do their jobs, or find creative new ways to get around the firewall. The solution to this dilemma adopted at Sandia National Laboratories is described. Discussion also covers risks of accessing the Web, design alternatives considered, and trade-offs used to find the proper balance between access and protection.

11949 (UCRL-JC–116492) **Scientific statistics and graphics on the Macintosh.** Grotch, S.L. Lawrence Livermore National Lab., CA (United States). Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404237–1: American Geophysical Union/Paclim workshop, Asilomar, CA (United States), 19-22 Apr 1994). Order Number DE95006445. Source: OSTI; NTIS; GPO Dep.

In many organizations scientists have ready access to more than one computer, often both a workstation (e.g., SUN, HIP, SGI) as well as a Macintosh or other PC. The scientist commonly uses the work station for "number-crunching" and data analysis whereas the Macintosh is relegated to either word processing or serves as a "dumb terminal" to a larger mainframe computer. In an informal poll of the author's colleagues, very few of them used their Macintoshes for either statistical analysis or for graphical data display. The author believes that this state of affairs is particularly unfortunate because over the last few years both the computational capability, and even more so, the software availability for the Macintosh have become quite formidable. In some instances, very powerful tools are now available on the Macintosh that may not exist (or be far too costly) on the so-called "high end" workstations. Many scientists are simply unaware of the wealth of extremely useful, "off-the-shelf' software that already exists on the Macintosh for scientific graphical and statistical analysis. This paper is a very personal view illustrating several such software packages that have proved valuable in the author's own work in the analysis and display of climatic datasets. It is not meant to be either an all-inclusive enumeration, nor is it to be taken as an endorsement of these products as the "best" of their class. Rather, it has been found, through extensive use that these few packages were generally capable of satisfying his particular needs for both statistical analysis and graphical data display. In the limited space available, the focus will be on some of the more novel features found to be of value.

11950 (UCRL-JC–118922) **Multigrid preconditioned conjugate gradients for the numerical simulation of groundwater flow on the Cray T3D.** Ashby, S.F. (Lawrence Livermore National Lab., CA (United States)); Falgout, R.D.; Smith, S.G.; Fogwell, T.W. Lawrence Livermore National Lab., CA (United States). Sep 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950420–17: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95006803. Source: OSTI; NTIS; GPO Dep.

This paper discusses the numerical simulation of groundwater flow through heterogeneous porous media. The focus is on the performance of a parallel multigrid preconditioner for accelerating convergence of conjugate gradients, which is used to compute the hydraulic pressure head. The numerical investigation considers the effects of enlarging the domain, increasing the grid resolution, and varying the geostatistical parameters used to define the subsurface realization. The results were obtained using the PARFLOW groundwater flow simulator on the Cray T3D massively parallel computer.

11951 (WHC-SA–2753) **An ugly duckling becomes a swan ...: How an organization becomes customer focused through listening.** Asercion, R.E. (Boeing Computer Services Co., Richland, WA (United States)); Myer, V.J. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950464–1: 17. national industrial energy technology conference - serving industry's needs, in conjunction with the spring regional conference of the Gulf Coast Cogeneration Association, Houston, TX (United States), 4-6 Apr 1995). Order Number DE95004974. Source: OSTI; NTIS; GPO Dep.

The story we're about to tell is true and the names have not been changed to protect the innocent because BCS Richland, Inc. (BCSR), a subsidiary of the Boeing Company, is proud of its metamorphosis from the ugly duckling of computer support to the shining swan-like star of the Help Desk industry. The transformation occurred in the midst of an all but antiquated computer technology environment, rapid technology changes, low employee morale, and high amount of customer frustration. BCSR, located at the Hanford site in the southeastern corner of Washington State, provides information resource management and computer support to the Department of Energy (DOE) complex located at the site. The primary mission of DOE is environmental restoration and waste clean-up. End User Support (EUS), an organization within BCSR, is tasked with all aspects of microcomputer support, both hardware and software. EUS efficiently and effectively supports approximately 12,000 computer users across the entire 560 square mile site. With a small staff of 50 consultants and technicians, EUS provides support to a diverse customer base that includes engineers and scientists, as well as financial personnel, managers, and clerical support. But it wasn't always this way. BCSR management recognized it and empowered the EUS staff to make the necessary changes. Here's how they did it.

11952 (WHC-SD-CP-CSUD–004-Rev.1) **PFP MICON view user manual.** Silvan, G.R. Westinghouse Hanford Co., Richland, WA (United States). 8 Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005297. Source: OSTI; NTIS; GPO Dep.

The basic operations of Sun Microsystem's Openwindows operating environment and MICRON Company's MICON View process software are covered.

11953 (WP–90-80) **Production costing simulation in thermal power systems using the mixture of conditional load distribution functions. Working paper.** Hoffer, J. (Computer and Automation Inst., Hungarian Academy of Sciences, P.O.Box 63, H-1502 Budapest (Hungary)); Doerfner, P. International Inst. for Applied Systems Analysis, Laxenburg (Austria). Dec 1990. 16p. Order Number DE95623580. Source: OSTI; NTIS (US Sales Only); INIS.

In the 1980's the cumulant method became popular in reliability type algorithms for production cost evaluation, particularly in the evaluation of loss-of-load probability (LOLP), energy not served (ENS) and expected energy generation (EEG) of a set of generating units belonging to an electric power system. We developed a probabilistic model which is able to handle the uncertainty of both generating units and peak load forecast. In order to model the load including peak load forecast uncertainty we use conditional probability distributions. We show that the cumulant method is still applicable, as we can compute all the moments of the load duration curve (load distribution) without discretizing the density function of peak load forecast. (authors).

11954 (WP–91-31a) **User's guide to CO2DB: The IIASA CO_2 technology data bank. Version 1.0.** Messner, S.; Strubegger, M. International Inst. for Applied Systems Analysis, Laxenburg (Austria). Oct 1991. 64p. Order Number DE95623574. Source: OSTI; NTIS (US Sales Only); INIS.

The data base includes detailed descriptions of the technical, economic, and environmental performance of technologies as well as data pertinent to their innovation, commercialization, and diffusion characteristics and prospects. Additional data files contain literature sources and assessments of data validity and concurrent uncertainty ranges. (authors).

Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE95007326. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the activities and progress for the 1994 Fall quarter for the UNLV Information Science Research Institute. Areas covered include: Symposium activity, Staff activity, Document analysis program, Text-retrieval program, and Institute activity.

11956 (EGG-M–94130) **Spent nuclear fuel management: A comprehensive database for the DOE Spent Nuclear Fuel Program.** Hale, D.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940985–8: American Society for Quality Control Energy and Environmental Quality Division conference, Tucson, AZ (United States), 18-21 Sep 1994). Order Number DE95005029. Source: OSTI; NTIS; GPO Dep.

An Integrated Spent Nuclear Fuel Database System (ISNFDS) has been designed by EG&G Idaho, Inc. at the Idaho National Engineering Laboratory (INEL) to maintain an inventory of all US Department of Energy (DOE) spent nuclear fuel (SNF). The purpose of the ISNFDS is to provide a centralized source of SNF information containing accurate and consistent data. A description of the quality control methodology, tools, and techniques for the data collection, entry, and verification process as they apply to the ISNFDS are outlined.

11957 (LA-UR–95-370) **Implementation of Unclassified Controlled Nuclear Information guidelines for fixed-site safeguards and security (FSSS) at Los Alamos National Laboratory.** Rood, P.L. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505162–2: DOE computer security training conference, Milwaukee, WI (United States), 2-4 May 1995). Order Number DE95006272. Source: OSTI; NTIS; GPO Dep.

Unclassified Controlled Nuclear Information (UCNI) is one type of sensitive information that DOE employees, including computer users, must now identify and protect. Guidelines to identify information as UCNI are gradually being put in place. The publication of Unclassified Controlled Nuclear Information Topical Guideline for Fixed-Site Safeguards and Security, TG-FSSS-1, is a major step in the development of UCNI guidelines. This DOE published guide cuts across and addresses many different programmatic areas including automated data processing. Our local guideline, Los Alamos National Laboratory Unclassified Controlled Nuclear Information Guideline for Fixed-Site Safeguards and Security, IG-LAFSSS-1, is based on TG-FSSS-1. In this paper, I plan to discuss the background of UCNI, the definition of UCNI, information that qualifies as UCNI, the consequences of information being UCNI, the development of UCNI guidelines, TG-FSSS-1 and IG-LAFSSS-1, the relationship of UCNI to classification, and the implementation of the IG-LAFSSS-1 at Los Alamos.

11958 (WHC-SD-WM-CM–002) **Configuration management plan for LABCORE Program.** Rich, H.S. Westinghouse Hanford Co., Richland, WA (United States). 3 Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005638. Source: OSTI; NTIS; GPO Dep.

A hardware/software configuration management plan for LABCORE. LABCORE is a laboratory information management system used by Analytical Services.

11959 (IAEA-INFCIRC–1(rev.11)) **Information circulars.** International Atomic Energy Agency, Vienna (Austria). Aug 1994. 140p. Order Number DE95622093. Source: OSTI; NTIS (US Sales Only); INIS.

Information circulars are published from time to time under the symbol INFCIRC/... for the purpose of bringing matters of general interest to the attention of all Members of the Agency. The present revision contains INFCIRCs published up to mid-August 1994. A complete numerical list of information circulars is reproduced with their titles in the Annex.

11960 (IAEA-INFCIRC–2(rev.44)) **The Members of the Agency.** International Atomic Energy Agency, Vienna (Austria). 19 Sep 1994. 19p. (In Arabic, Chinese, English, French, Russian, Order Number DE95622096. Source: OSTI; NTIS (US Sales Only); INIS.

The new members since the last list of Member States of the Agency was issued (INFCIRC/2/Rev.43) are: Kazakhstan and the former Yugoslav Republic of Macedonia. The Democratic People's Republic of Korea withdrew from membership of the Agency as of 13 June 1994. The Attachment hereto shows the dates on which the 121 States became members of the Agency, as well as those States whose application for membership of the Agency was approved by the General Conference, but who have not yet deposited an instrument of acceptance of the Statute.

11961 (IAEA-INFCIRC–8(rev.2)) **The financial regulations of the Agency.** International Atomic Energy Agency, Vienna (Austria). 30 Dec 1994. 180p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623452. Source: OSTI; NTIS (US Sales Only); INIS.

On 14 September 1994, the Board of Governors approved revised Financial Regulations of the Agency, with implementation of these Regulations beginning 1 January 1995. The Financial Regulations, as revised, are reproduced in this document for the information of all Member States.

11962 (IAEA-INFCIRC–136(add.3)) **The texts of the instruments concerning the Agency's assistance to Indonesia for the continuation of a research reactor project.** International Atomic Energy Agency, Vienna (Austria). Aug 1994. 96p. (In Arabic, Chinese, English, French, Russian, Order Number DE95622094. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the amendment to the Project Agreement between the International Atomic Energy Agency and the Government of the Republic of Indonesia for assistance by the Agency to Indonesia in continuing a research reactor project (Part I) and the Fourth Supply Agreement (Part II), which were approved by the Agency's Board of Governors on 4 December 1992 and concluded on 15 January 1993 between the Agency, the Governments of the Republic of Indonesia and the United States of America are reproduced herein for the information of all Members. The amendment to the Project Agreement and the Fourth Supply Agreement entered into force on 15 January 1993, pursuant to Articles VIII and VIII.1 respectively.

11963 (IAEA-INFCIRC–167(add.17)) **The text of the agreement to extend the regional co-operative agreement for research, development and training related to Nuclear Science and Technology, 1987. Status of acceptances as of July 1994.** International Atomic Energy Agency, Vienna (Austria). Aug 1994. 7p. (In Arabic, Chinese, English, French, Russian, Order Number DE95622095. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the agreement to extend the regional co-operative agreement for research, development and training related to nuclear science and technology, 1987 is reproduced.

11964 (IAEA-INFCIRC–209(rev.1/mod.2)) **Communications received from Member States regarding the export of nuclear material and of certain categories of equipment and other material.** International Atomic Energy Agency, Vienna (Austria). Apr 1994. 137p. (In Arabic, English, French, Russian, Spanish) Order Number DE95622097. Source: OSTI; NTIS (US Sales Only); INIS.

The Director General has received letters concerning the export of nuclear material and of certain categories of equipment and other material from the following Resident Representatives to the International Atomic Energy Agency: a letter dated 28 February 1994 from the Resident Representative of France; letters dated 1 March 1994 from the Resident Representatives of Australia, Austria, Bulgaria, Canada, the Czech Republic, Denmark, Finland, Germany, Greece, Hungary, Ireland, Japan, Luxembourg, Netherlands, Norway, Poland, Portugal, Spain, Sweden, the United Kingdom of Great Britain and Northern Ireland, and the United States of America; and a letter dated 22 March 1994 from the Resident Representative of Romania. In the light of the wish expressed at the end of each letter, the text of the letters is attached hereto.

11965 (IAEA-INFCIRC–254(rev.1/pt.1/mod.3)) **Communications received from Member States regarding guidelines for the export of nuclear material, equipment and technology.** International Atomic Energy Agency, Vienna (Austria). Nov 1994. 48p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623444. Source: OSTI; NTIS (US Sales Only); INIS.

The Director General has received notes verbales relating to the export of nuclear material, equipment and technology from the following Permanent Missions to the International Atomic Energy Agency: notes verbales dated 15 June 1994 from the Permanent Missions of Argentina, Australia, Austria, Belgium, Bulgaria, Canada, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, Luxembourg, Netherlands, Norway, Poland, Portugal, Romania, the Slovak Republic, Spain, Sweden, Switzerland, the United Kingdom of Great Britain and Northern Ireland and the United States of America; and a note verbale dated 10 November 1994 from the Permanent Mission of the Russian Federation. The purpose of these notes verbales is to provide further information on these Governments' nuclear export policies and practices. In the light of the wish expressed at the end of each note verbale, the analogous text of the notes verbales is attached hereto. The enclosure of these notes verbales with the amendments to the "Guidelines for Nuclear Transfers" contained in INFCIRC/254/Rev.1/Part 1/Mod.1 is reproduced in the Annex.

11966 (IAEA-INFCIRC–377(add.5)) **Text of an African regional co-operative agreement for research, development and training related to nuclear science and technology.** International Atomic Energy Agency, Vienna (Austria). 22 Sep 1994. 6p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623445. Source: OSTI; NTIS (US Sales Only); INIS.

As of 1 September 1994, notifications of acceptance of the African Regional Co-operative Agreement for Research, Development and Training Related to Nuclear Science and Technology (see INFCIRC/377), in accordance with Article XIII thereof, had been received by the Director General from the Governments of: Tunisia, Egypt, Algeria, Nigeria, Madagascar, Libya, Morocco, Kenya, Sudan, Ghana, Tanzania, Mauritius, Cameroon, South Africa, Zaire, Ethiopia, Zambia, Niger. The Agreement entered into force on 4 April 1990, the date of receipt of the third notification of acceptance.

11967 (IAEA-INFCIRC–447) **The withdrawal of the Democratic People's Republic of Korea from the International Atomic Energy Agency.** International Atomic Energy Agency, Vienna (Austria). 21 Jun 1994. 17p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623446. Source: OSTI; NTIS (US Sales Only); INIS.

The Minister for Foreign Affairs of the Democratic People's Republic of Korea has informed the Government of the United States of America, as depository of the Agency's Statute, in a diplomatic note dated 13 June 1994, that the Government of the Democratic People's Republic of Korea has decided to withdraw from the IAEA as of 13 June 1994. The Director General of the IAEA was notified of this withdrawal by a letter dated 15 June 1994 from the Resident Representative of the United States of America to the IAEA. The text of this letter and the enclosed diplomatic note from the DPRK are attached hereto. In accordance with Article XVIII, D of the Statute, the Board of Governors was informed on 15 June 1994 (GOV/INF/748). In compliance with the request of the Resident Representative of the United States of America, the Member States of the Agency are informed by this INFCIRC.

11968 (IAEA-INFCIRC–453) **Project and supply agreement. The text of the agreement of 15 January 1993 between the International Atomic Energy Agency and the Government of the Republic of Indonesia and the Government of the United States of America concerning the transfer of enriched uranium for the fabrication of targets for the production of radioisotopes for medical purposes.** International Atomic Energy Agency, Vienna (Austria). Aug 1994. 73p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623447. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the Project and Supply Agreement, which was approved by the Agency's Board of Governors on 4 December 1992 and concluded on 15 January 1993 between the Agency and the Governments of the Republic of Indonesia and the United States of America for the transfer of enriched uranium for the fabrication of targets for the production of radioisotopes for medical purposes is reproduced herein for the information of all Members. The agreement entered into force on 15 January 1993, pursuant to Article XII.1.

11969 (IAEA-INFCIRC–454) **Project and supply agreement. The text of the agreement of 15 January 1993 between the International Atomic Energy Agency and the Government of the Republic of Indonesia and the Government of the United States of America concerning the transfer of enriched uranium for materials test reactor fuel development.** International Atomic Energy Agency, Vienna (Austria). The Director General has received a note verbale dated 5 July 1994 from the Permanent Mission of New Zealand, providing information on the nuclear export policies and practices of the Government of New Zealand. In the light of the request expressed in the note verbale, the text of the note verbale is attached hereto.

11972 (IAEA-INFCIRC–460) **Project and supply agreement. The text of the agreement of 17 June 1993 between the International Atomic Energy Agency and the governments of Colombia and the United States of America concerning the transfer of enriched uranium for a research reactor.** International Atomic Energy Agency, Vienna (Austria). Dec 1994. 80p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623451. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the Project and Supply Agreement, which was approved by the Agency's Board of Governors on 25 February 1993 and 2 December 1993, between the Agency and the Governments of Colombia and the United States of America for the transfer of enriched uranium for a research reactor is reproduced herein for the information of all Members. The agreement entered into force on 17 June 1994, pursuant to Article XII.

11973 (INIS-BR–3472) **I.R.D. annual report - 1988. Institute of Radioprotection and Dosimetry of Brazilian Nuclear Energy Commission (CNEN).** Instituto de Radioprotecao e Dosimetria (IRD), Rio de Janeiro, RJ (Brazil). 1989. 152p. (In Portuguese). Order Number DE95623453. Source: OSTI; NTIS (US Sales Only); INIS.

This is the annual report of the activities developed by the Institute of Radioprotection and Dosimetry -IRD/CNEN-Brazil, in the year of 1988. It is composed by the individual reports of its several divisions, describing the main activities and personnel: DEPRO - Occupational and Radiological Protection Dept.; DEPRA - Environmental and Radiological Protection Dept.; DEMET - Metrology Dept.; DEPAT - Technical Support Dept.; DETAC - Scientific Support and Training Dept.; DEPAD -Administrative Support Dept. (J.A.M.M.).

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3 (Rev.1), *International Energy: Research Organizations 1988–1992*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

A

Aarhus Univ. (Denmark)
Interaction of hydrogen and oxygen with bulk defects and surfaces of metals, 20:11726 (R;DK)

Aarhus Univ. (Denmark). Inst. for Fysik og Astronomi
Interaction of hydrogen and oxygen with bulk defects and surfaces of metals, 20:11726 (R;DK)

Aarhus Univ. (Denmark). Oekonomisk Inst.
Price setting under cost uncertainty and menu costs - the case of the Danish petrol market, 20:9295 (R;DK)

Aarhus Universitetshospital (Denmark). Afd. for Onkologi
Continuous and split-course radiotherapy in locally advanced carcinoma of the uterine cervix. Analyses of local control, distant metastases, crude survival, early and late morbidity and prognostic factors, 20:10995 (R;DK)

Academy of Finland, Helsinki (Finland)
An analysis of the economic effects of global warming on Finland, 20:10125 (RA;FI)
Assessment of the impact of the greenhouse gas emission and sink scenarios in Finland on radiative forcing and greenhouse effect, 20:10847 (RA;FI)
Climate change and forest management alternatives, 20:10908 (RA;FI)
Climate change, living environment and ways of life, 20:10153 (RA;FI)
Climate models and scenarios, 20:10842 (RA;FI)
Climatic changes in Northern Europe, 20:10841 (RA;FI)
CO_2 fluxes in peatlands under varying temperature and moisture conditions, 20:9239 (RA;FI)
Differences in carbon accumulation of two cut-over peatlands in Finland, 20:9242 (RA;FI)
Economic and game-theoretical analysis of CO_2 reduction agreements, 20:10154 (RA;FI)
Economic effects of restricting carbon dioxide emissions, 20:10124 (RA;FI)
Emissions of methane and nitrogen oxides from peatland ecosystems, 20:9240 (RA;FI)
Estimation of biomass and other characteristics of Boreal forest over extensive areas using NOAA AVHRR data, 20:9831 (RA;FI)
Geographic information system for SILMU and the modelling of soil carbon flows, 20:10906 (RA;FI)
Impact of climate change on carbon cycle in freshwater ecosystems, 20:10947 (RA;FI)
Microclimatic models, estimation of solar radiation and evaporation over land surfaces, 20:10843 (RA;FI)
Northern forest plants under the pressure of environmental changes, 20:10907 (RA;FI)
Response of leaching from mire ecosystems to changing climate, 20:9241 (RA;FI)
Response of the boreal forest ecosystem to climatic change and its silvicultural implications, 20:10904 (RA;FI)
Sulfate aerosols and climate change, 20:10844 (RA;FI)
The behaviour of stratospheric and upper tropospheric ozone in high latitudes, 20:10845 (RA;FI)
The effects of elevated N-input and CO_2 on Sphagna with different trophic level, 20:10905 (RA;FI)
The Finnish research programme on climate change. Second progress report, 20:10798 (R;FI)
Tropospheric chemistry of greenhouse gases in Finnish conditions, 20:10846 (RA;FI)

AEA Decommissioning and Radwaste, Harwell (United Kingdom)
Assessment of radioactive waste disposal in clay, 20:9367 (R;GB)

Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States)
Investigation into the fractionation of refrigerant blends. Quarterly technical status report No. 1, April 1, 1994–June 30, 1994, 20:10476 (R;US)
Investigation into the fractionation of refrigerant blends. Quarterly technical status report No. 2, July 1, 1994–September 30, 1994, 20:10243 (R;US)
Materials Compatibility and Lubricants Research (MCLR) Program, 20:10129 (R;US)
Methods development for measuring and classifying flammability/combustibility of refrigerants. Interim report, Task 1 – Annotated bibliography and summary, 20:10214 (R;US)
Methods development for measuring and classifying flammability/combustibility of refrigerants. Interim report, task 2 - test plan, 20:10502 (R;US)
Products of motor burnout. Quarterly technical report, June 6, 1994–September 30, 1994, 20:10807 (R;US)

Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div.
A vehicle mounted multi-sensor array for waste site characterization, 20:9425 (R;US)
CMM functional software evaluation (algorithm qualification). Final report, 20:10774 (R;US)
Housing development for plasma electrode pockel cells. Final report, 20:10251 (R;US)
Metrology measurement capability, 20:10773 (R;US)
Pollution prevention opportunity assessment approach, training, and technical assistance for DOE contractors, 20:10148 (R;US)

Allison Engine Co., Indianapolis, IN (United States)
Advanced Turbine Systems program conceptual design and product development. Quarterly report, August–October 1994, 20:9933 (R;US)

Altamira Instruments, Inc., Pittsburgh, PA (United States)
Direct aromatization of methane. Quarterly technical progress report No. 7, April 1, 1994–June 30, 1994, 20:9851 (R;US)

AMAX Research and Development Center, Golden, CO (United States)
Engineering development of advanced physical fine coal cleaning for premium fuel applications. Quarterly technical progress report No. 8, July 1994–September 1994, 20:9202 (R;US)

American Iron and Steel Inst., Pittsburgh, PA (United States)
Austenite and ferrite grain size evolution in plain carbon steel, 20:10315 (R;US)
Modeling recrystallization kinetics during strip rolling, 20:10316 (R;US)

Amoco Oil Co., Naperville, IL (United States). Research and Development Dept.
The selective catalytic cracking of Fischer-Tropsch liquids to high value transportation fuels. Final report, 20:9208 (R;US)

AN SSSR, Moscow (Russian Federation)
Diagnostics of hardening coatings based on CrN_x by proton nuclear backscattering, 20:11710 (IA;RU;In Russian)

Use of the proton nuclear backscattering technique for investigation of nitration and oxidation process dynamics in structural steel nitrogenized layers, 20:11709 (IA;RU;In Russian)

AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki
Instanton - antiinstanton interaction and asymptotics of perturbation theory expansion of in double well oscillator, 20:11316 (R;RU)
Recoil correction in the Dirac-Coulomb problem, 20:11317 (R;RU)
Shnirelman peak in the level spacing statistics, 20:11238 (R;RU)

Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany)
AGF program budget 1994, 20:10162 (I;DE;In German)
Remote measurement of the large-area distribution of stratospheric trace gases, 20:10854 (IA;DE;In German)

Arbeitsgemeinschaft der Laender zur Reinhaltung der Weser, Bremen (Germany)
Report on the 1992 study trip on the Weser aboard the laboratory ship 'Max-Pruess' of the Land North-Rhine-Westfalia, 20:10941 (I;DE;In German)

Argonne National Lab., Idaho Falls, ID (United States)
Safety issues of dry fuel storage at RSWF, 20:9981 (R;US)
Spent fuel treatment at ANL-West, 20:9372 (R;US)

Argonne National Lab., IL (United States)
Analysis of the dimerized Sb/Si(001)-(2x1) surface by x-ray standing waves, 20:10470 (R;US)
Analytical electron microscopy characterization of uranium-contaminated soils from the Fernald Site, FY1993 report, 20:9691 (R;US)
Argonne Fuel Cycle Facility ventilation system -- modeling and results, 20:9980 (R;US)
Chelant extraction and REDOX manipulation for mobilization of heavy metals from contaminated soils, 20:10855 (R;US)
Chemically bonded phosphate ceramics for low-level mixed waste stabilization, 20:9370 (R;US)
Color measurements on marble and limestone briquettes exposed to outdoor environment in the Eastern United States. Volume I: Results of exposure 1984-1990, 20:9229 (R;US)
Comparison of several contemporary ionization/mass analyzer techniques for large components of complex fossil-derived materials, 20:9215 (R;US)
Computer modeling and experimental verification of figure-eight-shaped null-flux coil suspension system, 20:10288 (R;US)
Cryogenic separation of CO_2 from the fluegas of conventional coal-fired power plants, 20:9221 (R;US)
Decays rates for S- and P-wave bottomium, 20:11336 (R;US)
Development of control technology for emissions of mercury in flue gases, 20:9220 (R;US)
Economic evaluation of auto shredder residue pyrolysis plant design using process simulation software, 20:10239 (R;US)
Electron spectroscopy studies of argon K-shell excitation and vacancy cascades, 20:11700 (R;US)
ELIST (the Enhanced Logistics Intra-Theater Support Tool), a tool for analyzing theater movement constraints, 20:10782 (R;US)
Engineering analysis of CO_2 control and disposal in IGCC systems, 20:9219 (R;US)
Environmental geophysics at J-Field, Aberdeen Proving Ground, Maryland, 20:10787 (R;US)
Experimental determination of cluster geometrical structure, 20:10468 (R;US)
Foreign research reactor spent nuclear fuel inventories containing HEU and LEU of US-origin, 20:9337 (R;US)
How technology is improving decision making for environmental restoration, 20:10126 (R;US)
Innovative site characterization demonstration saves time and money, 20:9755 (R;US)
Keeping the peace green: Integrating arms control and environmental protection, 20:10293 (R;US)
Magnetic and structural properties of Fe/Pd multilayers studied by magnetic x-ray dichroism and x-ray absorption spectroscopy, 20:10305 (R;US)
Methodology and application of the WIMS-D4M fission product data, 20:9997 (R;US)
Methods for removing transuranic elements from waste solutions, 20:9369 (R;US)
Natural convection mass transfer on a vertical steel structure submerged in a molten aluminum pool, 20:10077 (R;US)
Neutronic study on conversion of SAFARI-1 to LEU silicide fuel, 20:10048 (R;US)
Nondestructive testing of ceramic engine components. Final progress report for completed CRADAs, 20:10350 (R;US)
Nuclear magnetic resonance tomography with a toroid cavity detector, 20:10771 (R;US)
Particle-like absorption spectra in small transition metal clusters, 20:10469 (R;US)
Pipeline corridors through wetlands - impacts on plant communities: Deep Creek and Brandy Branch crossings, Nassau County, Florida, 20:9318 (R;US)
Pipeline Corridors through wetlands -- Impacts on plant communities: Mill Creek Tributary Crossing, Jefferson County, New York, 1992 Survey, 20:9322 (R;US)
Recovery of UO_2/PuO_2 in IFR electrorefining process, 20:9443 (PA;US)
Separation science and technology. Semiannual progress report, April 1992–September 1992, 20:9368 (R;US)
Sintering of textured $YBa_2Cu_3O_{7-x}$ under intensive ^{60}Co gamma irradiation, 20:10351 (R;US)
Status of the US RERTR Program, 20:10050 (R;US)
Summary report for ITER task - D10: Update and improvement of neutron transport and activation codes and processed libraries, 20:11831 (R;US)
Surface energy driven crystallization of amorphous $Ni_{69}Cr_{14}P_{17}$ alloy, 20:10304 (R;US)
The oxidation state and magnetic behaviour of Tb in high-$T_c$related materials, 20:10349 (R;US)
The structure of lead-indium phosphate glass, 20:10390 (R;US)
Transient analyses and thermal-hydraulic safety margins for the Greek Research Reactor (GRRI), 20:10049 (R;US)
Use of labeled primers for differential display, 20:10954 (R;US)
Use of porous MgO in pyrochemical applications, 20:9371 (R;US)
Users guide for the ANL IBM SPx, 20:11905 (R;US)
White goods recycling in the United States: Economic and technical issues in recovering, reclaiming, and reusing nonmetallic materials, 20:10266 (R;US)

Arizona Univ., Tucson, AZ (United States)
Transport of subsurface bacteria in porous media, 20:10860 (R;US)

Arizona Univ., Tucson, AZ (United States). Coll. of Engineering and Mines
Drive reinforcement neural networks for reactor control. Final report, 20:10025 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Chemistry
Single molecule detection using charge-coupled device array technology. Final report, 20:10763 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Hydrology and Water Resources
Stochastic modeling of macrodispersion in unsaturated heterogeneous porous media. Final report, 20:10859 (R;US)

Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil)
Improvement of the cogeneration facilities, considering the aspects of financial risks, 20:10109 (I;BR;In Portuguese)
Natural circulation in pressurized water reactors, 20:9961 (I;BR)
Numerical simulation of the heating and start-up of PWR nuclear power station, 20:10032 (I;BR;In Portuguese)
Pressure drop redistribution experimental analysis in axial flow along the bundles, 20:9962 (I;BR;In Portuguese)
Thermal-economic analysis of cogeneration systems, 20:10110 (I;BR;In Portuguese)

Associacao Brasileira de Engenharia Sanitaria e Ambiental, Rio de Janeiro, RJ (Brazil)
Environmental radiation monitoring in Sao Paulo state, 20:11084 (I;BR;In Portuguese)
Methanol as fuel: evaluation of atmosphere contamination, 20:9849 (I;BR;In Portuguese)

Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)
High Z material operation in FTU, 20:11848 (R;IT)

Atomic Energy Establishment, Cairo (Egypt)
Future scientific trends in radiation protection and civil defence, 20:11090 (IA;EG)

On the implementation of 1990 ICRP recommendations, 20:9801 (IA;EG)
Potassium body burdens in occupational users of egyptian nuclear research center, 20:11091 (IA;EG)
Research activities related to internal contamination and bioassay and experience gained in this field, 20:11092 (IA;EG)
Safe Transport of radioactive materials and other activities, 20:9342 (IA;EG;In Arabic)
Thermoluminescence properties of bone equivalent calcium phosphate ceramics, 20:10697 (IA;EG)
Water treatment process for nuclear reactor, 20:10016 (IA;EG)

Atomic Energy Establishment, Inshas (Egypt). Neutron Physics Dept.
Radiation Protection and Civil defence Department, 20:11089 (I;EG)

Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.
A review of analytical techniques for the determination of carbon-14 in environmental samples, 20:10429 (R;CA)

Atomic Energy Regulatory Board, Bombay (India)
Annual report 1991-92, 20:9991 (I;IN)
Annual report 1992-93, 20:11891 (I;IN)

Auburn Univ., AL (United States). Dept. of Chemical Engineering
Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, September 20, 1994–December 20, 1994, 20:9211 (R;US)

Augsburg Univ. (Germany). Inst. fuer Volkswirtschaftslehre
The data envelopment analysis efficiency of public power suppliers. A contribution to the discussion of deregulation, 20:10191 (R;DE;In German)

Avaplan Oy, Espoo (Finland)
Handbook of methods for risk-based analyses of technical specifications, 20:10099 (R;US)

B

Babcock and Wilcox Co., Alliance, OH (United States)
Engineering development of advanced coal-fired low-emission boiler systems. Quarterly technical progress report, April 1, 1994–June 30, 1994, 20:9937 (R;US)

Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div.
Development of a prototype lignin concentration sensor. Final report. Draft, 20:9836 (R;US)

Battelle, Columbus, OH (United States)
Effect of dynamic strain aging on the strength and toughness of nuclear ferritic piping at LWR temperatures, 20:9952 (R;US)

Battelle-Institut e.V., Frankfurt am Main (Germany)
Application on-oriented fundamental research on electrochromic layers for controlling the total energy transmission rate of windows, illustrated by the example of window panes. Development of fundamentals for a novel backplate electrode. Final report, 20:10250 (R;DE;In German)

Berliner Elektronenspeicherring-Gesellschaft fuer Synchrotronstrahlung mbH (BESSY), Berlin (Germany)
Berliner Elektronenspeicherring-Gesellschaft fuer Synchrotronstrahlung (BESSY). Annual report 1993, 20:10673 (I;DE;In German)

Bhabha Atomic Research Centre, Bombay (India)
Alkaline hydrolysis process for treatment and disposal of Purex solvent waste, 20:9374 (R;IN)
An interactive system for seismic signal detection and identification, 20:10791 (R;IN)
Leukemia data analysis for fast neutron RBE- a simplified approach for radiation protection., 20:11063 (R;IN)
Removal of radioruthenium from alkaline intermediate level radioactive waste solution : a laboratory investigation, 20:9373 (R;IN)
Tri butyl phosphate process for actinide partitioning from high level wastes, 20:9332 (R;IN)

Bio-Process Innovation, Inc., West Lafayette, IN (United States)
A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams. 3rd Quarterly report, October 15, 1994–January 15, 1995, 20:9835 (R;US)

Bochum Univ. (Germany). Fakultaet fuer Maschinenbau
Experimental investigation of turbulent particle dispersion in swirling flows, 20:10540 (R;DE;In German)
Modelling of subcooled boiling in ATHLET and application in water cooled research reactors, 20:10074 (R;DE;In German)

Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet
The calculation of the quark distribution amplitudes of decuplet baryons by means of QCD sum rules, 20:11315 (R;DE;In German)

Bonn Univ. (Germany). Physikalisches Inst.
The calculation of the quark distribution amplitudes of decuplet baryons by means of QCD sum rules, 20:11315 (R;DE;In German)

Brandeis Univ., Waltham, MA (United States). Dept. of Physics
Research in elementary particle physics. Technical progress report, June 1, 1993–May 31, 1994, 20:10684 (R;US)

Bremen Univ. (Germany). Fachbereich 5 - Geowissenschaften
The distribution of heavy metals in the sediments of a basin of the harbour of Bremen, 20:10942 (R;DE;In German)

Brookhaven National Lab., Upton, NY (United States)
Acceleration theorems, 20:10619 (R;US)
Accelerator-driven assembly for plutonium transformation (ADAPT), 20:10604 (R;US)
Aircraft impact analysis for the HFBR, 20:10078 (R;US)
Alternative way to dispose of high-level waste in outer space, 20:9375 (R;US)
Analysis of failure dependent test, repair and shutdown strategies for redundant trains, 20:10079 (R;US)
Anomalous cloud absorption? A critique of the paper entitled "Absorption of Solar Radiation by Clouds: Observations Versus Models", 20:10801 (R;US)
Assay of weathering effects on protective polymer coatings using positron annihilation spectroscopy, 20:10394 (R;US)
Boron dose determination for BNCT using Fricke and EPR dosimetry, 20:11064 (R;US)
Brookhaven National Laboratory site environmental report for calendar year 1993, 20:9692 (R;US)
Cell synchrony and chromosomal protocols for somatic cells of cotton gossypium hirsutum, 20:9832 (R;US)
Characterization of defects in deuterium-implanted beryllium, 20:11832 (R;US)
Closed orbit related problems: Correction, feedback, and analysis, 20:10616 (R;US)
Coupling correction using closed orbit measurements, 20:10615 (R;US)
Development of high temperature, corrosion resistant polymer concrete for use in the steam distribution system of the Consolidated Edison Company of New York. Final report, 20:10391 (R;US)
Eigenvector method for optimized orbit correction, 20:10617 (R;US)
Electronic phase separation and high temperature superconductors, 20:11732 (R;US)
Emergency diesel generator: Maintenance and failure unavailability, and their risk impacts, 20:10096 (R;US)
Field flattening in superconducting beam transport magnets, 20:10614 (R;US)
Field quality improvements in superconducting magnets for RHIC, 20:10631 (R;US)
Handbook of methods for risk-based analyses of technical specifications, 20:10099 (R;US)
Health and environmental hazards of CdTe photovoltaic module production, use and decommissioning, 20:9874 (R;US)
Induced axial oscillations in superconducting dipole windings, 20:10629 (R;US)
Lessons learned from a hydrogen explosion at a photovoltaic research facility, 20:9873 (R;US)
Lightweight CO_2-resistant cements for geothermal well completions, 20:9888 (R;US)
Low noise monolithic Si JFETs for operation in the 90-300K Range and in high radiation environments, 20:10678 (R;US)
Magnetic field measurements of the harmonic generation FEL superconducting undulator at BNL-NSLS, 20:10632 (R;US)
Manufacture and testing of the superconducting wire and cable for the RHIC dipoles and quadrupoles, 20:10630 (R;US)

Neural network technique for orbit correction in accelerators/storage rings, 20:10618 (R;US)
Optical design and performance of the inelastic scattering beamline at the National Synchrotron Light Source, 20:10633 (R;US)
PC-MARKAL (MUSS). Energy Systems Optimization Model and User's Support System, 20:11920 (CM;US)
Performance of an accordion electromagnetic calorimeter with liquid krypton, 20:10676 (R;US)
Precision electromagnetic calorimetry with liquid krypton, 20:10677 (R;US)
Preliminary heavy-light decay constants from the MILC Collaboration, 20:11337 (R;US)
Proceedings of the Fifth International Workshop on Targetry and Target Chemistry, 20:10497 (R;US)
Rare decays/CP: The perspective of a kaon physicist, 20:11338 (R;US)
Rebuilding the Brookhaven high flux beam reactor: A feasibility study, 20:10051 (R;US)
Results/prospects in E777/851/865, 20:11339 (R;US)
Scientific opportunities for FEL amplifier based VUV and X-ray research, 20:10605 (R;US)
Specification of the figure and finish of EUV mirrors in terms of performance requirements. Revision 11/94, 20:10762 (R;US)
Surface crystallization and thin film melting in normal alkanes, 20:10392 (R;US)
Synthesis, tissue uptake, and toxicity of a nickel tetracarboranylphenylporphyrin, 20:10965 (R;US)
The effects on photosynthetic CO_2 assimilation to long-term elevation of atmospheric CO_2 concentration: An assessment of the response of Trifolium Repens L. cv. Blanca grown at F.A.C.E., 20:10799 (R;US)
The whitehouse effect: shortwave radiative forcing of climate by anthropogenic aerosols, 20:10800 (R;US)
Update of GALLEX solar neutrino results and implications, 20:11260 (R;US)
US technical assistance to two specialized agencies of the UN, 20:10294 (R;US)
X-ray and neutron reflectivity, 20:10553 (R;US)

Brown Univ., Providence, RI (United States). Dept. of Physics
Detection of charged particles in superfluid helium, 20:11262 (R;US)

Brown Univ., Providence, RI (United States). Div. of Engineering
Vapor pressures and heats of vaporization of primary coal tars. Quarterly technical progress report, July 1, 1994–September 30, 1994, 20:9218 (R;US)

Bundesamt fuer Gesundheitswesen, Fribourg (Switzerland). Abt. Strahlenschutz
Environmental radioactivity and radiation exposure in Switzerland 1993, 20:11099 (I;CH;In German, French, Italian, English)

Bundesamt fuer Strahlenschutz, Berlin (Germany)
Activity standards for calibration of activity measuring instruments, 20:10707 (IA;DE;In German)
Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG), 20:10818 (I;DE;In German)
Demands on quality control of radioactivity measurements and examples of how to perform it, 20:10705 (IA;DE;In German)
Demands on sample preparation of milk, milk products, plants, animal feeds, fertilizers and soil for radioactivity monitoring, 20:10877 (IA;DE;In German)
Demands on the sampling of milk, plants, animal feeds, fertilizers and soil for radioactivity monitoring, 20:10874 (IA;DE;In German)
Detection limits and measuring uncertainties, 20:10704 (IA;DE;In German)
IMIS as an information engineering system, 20:10819 (IA;DE;In German)
Legal foundations of radioactivity measurements in the Federal Republic of Germany within the framework of precautionary radiation protection (normal operation), 20:11100 (IA;DE;In German)
Notes on sample preparation of food: food of plant and animal origins, and daily meals, 20:10876 (IA;DE;In German)
On the taking of representative water, suspended matter and sediment samples from inland waters, 20:11101 (IA;DE;In German)
Problems of alpha spectroscopy, 20:10700 (IA;DE;In German)
Problems of laboratory-scale gamma spectroscopy, 20:10701 (IA;DE;In German)
Problems of Sr-90 analysis, 20:10702 (IA;DE;In German)
Problems of tritium detection in water, 20:10703 (IA;DE;In German)
Progress report on the "Regulatory Guide on emission and immission monitoring of nuclear facilities", 20:10820 (IA;DE;In German)
Quality assurance and quality control from the point of view of a measuring point of a land, 20:10706 (IA;DE;In German)
Report by a Land-sponsored measuring point in the Western Laender of Germany on specific problems and experience related to the translation into practics of measuring programs, 20:10708 (IA;DE;In German)
Requirements to be met by data acquisition and reporting, 20:10709 (IA;DE;In German)
Sample preparation of drinking, ground and waste water as well as of sewage sludge, residual materials and wastes, 20:10940 (IA;DE;In German)
Sampling of drinking, ground and waste waters as well as of sewage sludge, residual materials and waste, 20:10939 (IA;DE;In German)
Special applications of gamma spectroscopy: on-line and in-situ spectroscopy, 20:10878 (IA;DE;In German)
Special aspects of sampling for radiation monitoring of food, 20:10875 (IA;DE;In German)
The Integrated Measuring and Information System for monitoring environmental radioactivity (IMIS): tasks, objectives and components, 20:10699 (IA;DE;In German)

Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Sozialmedizin und Epidemiologie
Thermoluminescence analysis to detect irradiated fruit and vegetables - an intercomparison study. A report in English and German, 20:11062 (R;DE;In English, German)
Thermoluminescence of irradiated foods, 20:11061 (R;DE;In German)

Bundesministerium fuer Forschung und Technologie, Bonn (Germany)
R+D programme 'Environmental engineering'. R+D projects 1994. Data of September 1, 1994, 20:10164 (I;DE;In German)

Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany)
Activity standards for calibration of activity measuring instruments, 20:10707 (IA;DE;In German)
Application of the routine measuring program in the five new German Laender. Exchange of experience among the administrative authorities of the Federal Government according to paragraph 11 StrVG and among the measuring stations of the Laender according to paragraph 3 Preventive Radiation Protection Act (StrVG), 20:10818 (I;DE;In German)
Demands on quality control of radioactivity measurements and examples of how to perform it, 20:10705 (IA;DE;In German)
Demands on sample preparation of milk, milk products, plants, animal feeds, fertilizers and soil for radioactivity monitoring, 20:10877 (IA;DE;In German)
Demands on the sampling of milk, plants, animal feeds, fertilizers and soil for radioactivity monitoring, 20:10874 (IA;DE;In German)
Detection limits and measuring uncertainties, 20:10704 (IA;DE;In German)
IMIS as an information engineering system, 20:10819 (IA;DE;In German)
Legal foundations of radioactivity measurements in the Federal Republic of Germany within the framework of precautionary radiation protection (normal operation), 20:11100 (IA;DE;In German)
Notes on sample preparation of food: food of plant and animal origins, and daily meals, 20:10876 (IA;DE;In German)
On the taking of representative water, suspended matter and sediment samples from inland waters, 20:11101 (IA;DE;In German)
Problems of alpha spectroscopy, 20:10700 (IA;DE;In German)
Problems of laboratory-scale gamma spectroscopy, 20:10701 (IA;DE;In German)
Problems of Sr-90 analysis, 20:10702 (IA;DE;In German)
Problems of tritium detection in water, 20:10703 (IA;DE;In German)

Progress report on the "Regulatory Guide on emission and immission monitoring of nuclear facilities", 20:10820 (IA;DE;In German)
Quality assurance and quality control from the point of view of a measuring point of a land, 20:10706 (IA;DE;In German)
Report by a Land-sponsored measuring point in the Western Laender of Germany on specific problems and experience related to the translation into practics of measuring programs, 20:10708 (IA;DE;In German)
Requirements to be met by data acquisition and reporting, 20:10709 (IA;DE;In German)
Sample preparation of drinking, ground and waste water as well as of sewage sludge, residual materials and wastes, 20:10940 (IA;DE;In German)
Sampling of drinking, ground and waste waters as well as of sewage sludge, residual materials and waste, 20:10939 (IA;DE;In German)
Special applications of gamma spectroscopy: on-line and in-situ spectroscopy, 20:10878 (IA;DE;In German)
Special aspects of sampling for radiation monitoring of food, 20:10875 (IA;DE;In German)
Survey of reportable events in nuclear power plant in the Federal Republic of Germany. Period covered: 3rd quarter 1993, 20:10087 (I;DE;In German)
Survey of reportable events in nuclear power plants in the Federal Republic of Germany. Period covered: 3rd quarter 1994, 20:10089 (I;DE;In German)
The Integrated Measuring and Information System for monitoring environmental radioactivity (IMIS): tasks, objectives and components, 20:10699 (IA;DE;In German)

Bundesversuchs- und Forschungsanstalt Arsenal, Vienna (Austria)
The tritium content of precipitation and surface water in Austria in 1992, 20:10040 (R;AT;In German)
The tritium content of precipitation and surface water in Austria in 1993, 20:10041 (R;AT;In German)

Design data summary: Mark VIA fuel elements, 20:10059 (R;US)

Duesseldorf Univ. (Germany)
Charge transport and recombination investigations in hydrogenated amorphous silicon (a:Si:H) pin diodes by its forward current mode, 20:10581 (R;DE;In German)
Development of a FE method for modelling plasma flows in tokamak plasma edges, 20:11861 (R;DE;In German)

Duke Univ., Durham, NC (United States). Dept. of Mechanical Engineering and Materials Science
Novel carbon-ion fuel cells. Third quarter 1994 technical progress report, 20:10208 (R;US)

E

EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab.
An aerial radiological survey of the project Rio Blanco and surrounding area, 20:10865 (R;US)
An aerial radiological survey of the neutron products company and surrounding area, 20:10866 (R;US)

EG and G Energy Measurements, Inc., Pleasanton, CA (United States)
Shielded serpentine traveling wave tube deflection structure, 20:10589 (PA;US)
The challenge of emergency response dispersion models on the meso-gamma urban scale: A case study of the July 26, 1993 oleum tank car spill in Richmond, California, 20:10809 (R;US)

EG and G Idaho, Inc., Idaho Falls, ID (United States)
A middle path for electricity options and sustainable development, 20:10175 (R;US)
A rapid method for the direct analysis of boron in whole blood by atomic emission spectroscopy, 20:10433 (RA;US)
Analytical dosimetry and treatment planning for BNCT, 20:10970 (RA;US)
Bioavailability of intravenous formulations of p-boronophenylalanine in dog and rat, 20:10960 (RA;US)
Boron delivery to tumors mediated by macromolecules and vesicles, 20:10974 (RA;US)
Buried Waste Integrated Demonstration lessons learned: 1993 technology demonstrations, 20:9400 (R;US)
Carbonyl nonahydrodecaborate(1-): A versatile synthon for functionalized borane anions, 20:10973 (RA;US)
Cardiovascular toxicities associated with intravenous administration of p-boronophenylalanine formulations, 20:11226 (RA;US)
Computer modeling the boron compound factor in normal brain tissue, 20:10979 (RA;US)
Computer modeling the boron compound factor in brain tumors, 20:10980 (RA;US)
Creating and using a type of free-form geometry in Monte Carlo particle transport, 20:11679 (RA;US)
Determination of fast-neutron dose distributions in the canine central nervous system, 20:11073 (RA;US)
Determination of strongly protein-bound borocaptate species by high performance liquid chromatography with on-line inductively coupled plasma atomic emission spectroscopy detection of boron, 20:10435 (RA;US)
Device for aqueous detection of nitro-aromatic compounds, 20:10779 (PA;US)
Dose effect comparisons between HFR and BMRR irradiated dogs with respect to healthy tissue tolerance, 20:11072 (RA;US)
Dose optimization for boron neutron capture therapy of spontaneous canine brain tumors, 20:10981 (RA;US)
Dual annular rotating "windowed" nuclear reflector reactor control system, 20:10037 (PA;US)
Electromagnetic hysteretic response calculation for superconductors in demagnetizing geometries, 20:11733 (R;US)
Enantioselective synthesis of an unnatural amino acid, L-carboranylalanine, 20:10972 (RA;US)
Greater-than-Class C low-level radioactive waste characterization: Estimated volumes, radionuclide activities, and other characteristics. Revision 1, 20:9382 (R;US)
Integrated approach to hazardous and radioactive waste remediation, 20:9399 (R;US)
Large animal normal tissue tolerance using an epithermal neutron beam and borocaptate sodium, 20:10968 (RA;US)
Large animal studies of the use of BNCT for the treatment of brain tumors, 20:10978 (RA;US)

Liposomal delivery of boron to murine tumors for boron neutron capture therapy, 20:10975 (RA;US)
Long-Term Flow Test No. 1, Roosevelt Hot Springs, Utah, 20:9875 (R;US)
Low density lipoprotein reconstitutions with alkyl and aryl carboranes, 20:10976 (RA;US)
NMR studies of the interaction of borocaptate sodium with serum albumin, 20:10977 (RA;US)
Nuclear characterization of the HFR Petten BNCT facility, 20:10969 (RA;US)
Performance indicators for first quarter CY 1994, 20:9403 (R;US)
Petrography, age, and paleomagnetism of basalt lava flows in coreholes Well 80, NRF 89-04, NRF 89-05, and ICPP 123, Idaho National Engineering Laboratory, 20:10916 (R;US)
Pharmacokinetics of borocaptate sodium in canine head determined by ^{11}B magnetic resonance imaging and spectroscopy, 20:10959 (RA;US)
Post treatmeat dose distribution evaluation for a recent NCT patient, 20:10971 (RA;US)
Proceedings of the Third NRC/ASME Symposium on Valve and Pump Testing. Volume 2, Session 3A–Session 4B, 20:10018 (R;US)
Purity and quality determinations of borocaptate sodium, 20:10480 (RA;US)
Quantification of boron in biological tissue by secondary ion mass spectrometry, 20:10434 (RA;US)
Radial flow nuclear thermal rocket (RFNTR), 20:9987 (PA;US)
Spent nuclear fuel management: A comprehensive database for the DOE Spent Nuclear Fuel Program, 20:11956 (R;US)
Spray-formed tooling, 20:10508 (R;US)
Stormwater management at the ARID INEL, 20:10141 (R;US)
The production of high energy neutrons by secondary reactions, 20:11606 (R;US)
The role of chemistry in the development of boron neutron capture therapy of cancer, 20:10967 (RA;US)
The use of boron neutron capture for the treatment of pituitary tumors, 20:10982 (RA;US)
Viscosity-based high temperature waste form compositions, 20:9402 (R;US)

EG and G Rocky Flats, Inc., Golden, CO (United States)
Adsorption study for uranium in Rocky Flats groundwater, 20:9752 (R;US)
Designing radiation protection signs, 20:11221 (R;US)

EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant
Cementation and solidification of miscellaneous mixed wastes at the Rocky Flats Environmental Technology Site, 20:9472 (R;US)

Electric Power Research Inst., Palo Alto, CA (United States)
Electric Power Research Institute, Environmental Control Technology Center report to the Steering Committee, October 1994, 20:9942 (R;US)
Environmental Control Technology Center - report to the Steering Committee, final technical report, 20:9227 (R;US)

Electricite de France (EDF), 92 - Clamart (France)
Benchmark calculations of power distribution within assemblies, 20:10010 (R;XN)

Electronic Systems Div., L.G. Hanscom Field, MA (United States)
Portable reconfigurable line sensor (PRLS) and technology transfer, 20:9790 (R;US)

ENEA, Bologna (Italy)
Absorbed dose per unit fluence for tissue equivalent slab phantoms for electron from 50 keV to 10 MeV, 20:11077 (R;IT)

ENEA, Bologna (Italy). Area Energia Ambiente e Salute
Atmospheric aerosol monitoring in urban areas and near motorways with high traffic rate, 20:10811 (R;IT;In Italian)
Effects of active inhalation of trichloroethylene on rat respiratory tract, 20:11227 (R;IT;In Italian)
Implementation of algorithms based on a new electron model in MCNP: Underpinned by Moliere theory, 20:11680 (R;IT)

ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione
ENDF/B VI iron validation onpca-replica (H2O/FE) shielding benchmark experiment, 20:11681 (R;IT)
Laser welding process simulation for ship building industry: Strategy and optimization, 20:10317 (R;IT)
Nonhomogeneous nonequilibrium heat transfer model for subcooled boiling of water in uniformly heated vertical tubes, 20:10543 (R;IT)
Thermal and mechanical response of steel sheets welded by laser process: Preanalysis made by ABAQUS code, 20:10318 (R;IT)
Using lapack routines in nag fortran library: Experiences and comparisons, 20:11912 (R;IT)

ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone
Contributions to 6. international conference on fusion reactor materials, 20:11840 (R;IT;In Italian)
Corrosion and low cycle fatigue properties of AISI 316 L in flowing Pb-17 Li, 20:11842 (RA;IT)
Experimental studies on hydrogen diffusion and trapping in martensitic and austenitic stainless steels for fusion application, 20:11841 (RA;IT)
Thermomechanical cycling tests of coated AISI 316 L in Pb-17Li, 20:11843 (RA;IT)

ENEA, Casaccia (Italy). Area Energetica
Advanced electrolysers supplied by photovoltaic power systems, 20:9826 (R;IT;In Italian)
Hypercomplex numbers, functions of hypercomplex variable and physical fields, 20:11910 (R;IT;In Italian)

ENEA, Casaccia (Italy). Area Energia Ambiente e Salute
Environmental analysis in two manufacturing firms of Civita Castellana disctrict (Italy), 20:10142 (R;IT;In Italian)
Portable Kit for inroad sampling on environmental matrixes, 20:10868 (R;IT;In Italian)
Soil erosion measurement in Abruzzo (Italy): Comparison among different methodologies, 20:10869 (R;IT;In Italian)

ENEA, Casaccia (Italy). Area Energia e Innovazione
Description of ELEBEAM calculation code, 20:11078 (R;IT;In Italian)
Effects of gamma radiations in hydrogenated amorphous silicon layers, 20:10397 (R;IT;In Italian)
Environmental attack effects on Li2ZrO3 and properties evolution as a function of the fabrication route, 20:10358 (R;IT)
First experiments of parallel application in ENEA (Italian National Agency for New Technologies, Energy and the Environment): Neural networks, 20:11915 (R;IT;In Italian)
Full-wave analysis of indefinite microstrip lines and microstrip discontinuities, 20:10578 (R;IT;In Italian)
Generalized Bessel functions and Kapteyn series, 20:11913 (R;IT)
Generating function method and properties of relativistic hermite polynomials, 20:11916 (R;IT)
Hospital waste sterilization: Technical-economic comparison between radiation and microwaves treatment technologies, 20:10269 (R;IT;In Italian)
Study on pesticide's use in Latina and Grosseto (Italy), 20:11228 (R;IT;In Italian)
Trine experimental program and materials characterization, 20:10061 (R;IT)

ENEA, Casaccia (Italy). Centro Ricerche Energia
Real, hyperbolic and complex quadratic maps, 20:11909 (R;IT;In Italian)

ENEA, Frascati (Italy)
Betatron motion and linear undulator brightness: Inhomogeneous broadening effects due to e-beam emittance and Twiss parameters, 20:11265 (R;IT)

ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione
Analytical method for compact discharge electrodes in asymmetrical geometries, 20:10570 (R;IT)
Betraton motion and linear undulator brightness: Inhomogeneous broadening effects due to e-beam emittance and Twiss parameters, 20:11256 (R;IT)
Biological fatigue evaluation in fighting sports by remote sensing techniques, 20:11234 (R;IT;In Italian)
Color center laser at 1.5 μm with a new configuration, 20:10575 (R;IT)
Colored layers of LiF for integrated optical devices, 20:10577 (R;IT)
Compact three electrodes excimer laser 'IANUS' for POPA optical system, 20:10573 (RA;IT)

Contributions to international symposium on high power lasers, 20:10571 (R;IT)
Design criteria and test results of compact self-focusing radiographic linac, 20:10606 (R;IT)
Electron beam propagation in linearly polarized undulators: Effect of anharmonicity on spatial and phase-space distributions, 20:11257 (R;IT)
Free electron laser dynamics, evolution of bunching coefficients and coherent harmonic generation, 20:10579 (R;IT)
Generalized forms of Bessel functions and Hermite polynomials, 20:11241 (R;IT)
Laser synthesis and microstructural characterization of ceramic nanosized powders, 20:10357 (RA;IT)
Linefit 2.0 a software for reduction of spectroscopical data, 20:11911 (R;IT)
Model for saturation of storage ring free electron laser, 20:10672 (R;IT)
New technique for discharge electrodes design including asymmetric geometries, 20:10572 (RA;IT)
Phase-space formalism: Generalized harmonic oscillator functions, 20:11914 (R;IT)
Photosyntetic activity and electron trasport measurements using laser pump and probe technique, 20:10870 (R;IT)
Quantistic perturbative methods applied to classical mechanics, 20:11242 (R;IT;In Italian)
Quantum statistical approach to H(D)-Pd system: Evaluation of thermodynamical functions of state from experimental data, 20:11731 (R;IT)
Quantum yield measurements of photochemistry activity of plants exposed to pollutant gases, 20:10767 (R;IT)
Report of third LASFLEUR field campaign for remote sensing of vegetation health: ENEA contribution, 20:10766 (R;IT)
Self-injected XeCl excimer laser, 20:10574 (R;IT)
Simple analysis of power load on the wall of IGNITOR Tokamak during normal operation, 20:11787 (R;IT)
Soft x-ray sources: Comparison, 20:11682 (R;IT)
Split-operator technique and solution of Liouville propagation equations, 20:10576 (R;IT)

ENEA, Frascati (Italy). Dipt. Fusione
14 MeV Frascati Neutron Generator, 20:10636 (RA;IT)
Alpha-particle induced collective effects in reactor-relevant plasmas, 20:11793 (R;IT)
Calibration of the neutron profile monitor diagnostic at JET by means of the Monte Carlo code for Neutron and Photon transport MCNP, 20:11792 (R;IT)
Contributions to 6. international conference on fusion reactor materials, 20:11844 (R;IT)
Deuterium charging in palladium by electrolysis of heavy water: Measurement of lattice parameter, 20:11789 (R;IT)
Discussion on prospects of fusion energy and on lines of development of improved tokamak reactors, 20:11849 (R;IT)
Energy confinement in FTU ohmic plasma, 20:11794 (R;IT)
Global particle balance and local particle transport in Frascati Tokamak Upgrade, 20:11791 (R;IT)
ICF target physics: (a) Rayleigh-Taylor instabilities; (b) heavy-ion driven targets, 20:11790 (R;IT)
Mass-matrices of weak interaction, quark flavour mixing and exponential form of Cabibbo-Kobayashi-Maskawa matrix, 20:11322 (R;IT)
Outgassing tests on graphites in temperature range 373-1873 K, 20:11845 (RA;IT)
Physics and technology issues in our present view of design of a Tokamak reactor, 20:11850 (R;IT)
Quasilinear absorption of lower hybrid waves in tokamak plasmas, 20:11788 (R;IT)
Silicon deposition on stainless steel surfaces in view of conditioning of FTU vacuum chamber, 20:11846 (RA;IT)
Soil pollutants detection using a mobile Lidar Fluorosensor, 20:10765 (R;IT;In Italian)
Stainless steel bulk shielding benchmark experiment at FNG, 20:11847 (RA;IT)
Temperature growth-up and mechanical loads on ENEA facility CICC test, 20:11851 (R;IT)

ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa
Results of some models of near-field dispersion of effluents from submerged outfalls, 20:10810 (R;IT;In Italian)

ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute
Application of collinear tracks method to analyse ers-1 altimeter data for mapping contouring lines of Rms variability, 20:10936 (R;IT)

ENEA, Portici (Italy). Centro Ricerche Fotovoltaiche
Circuit simulation of amorphous silicon thin film transistors and evaluation of their driving method, 20:10569 (R;IT;In Italian)

ENEA, Rome (Italy)
Tridimensional analysis of Los Alamos accelerator driven transportation system, 20:9412 (R;IT)

ENEA, Rome (Italy). Area Nucleare
Inhomogeneous broadening parameters in Thomson-backscattering-based sources, 20:10620 (R;IT)

ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute
Considerations on environmental aspects of radiation protection. Proceedings, 20:11076 (R;IT)
Evolution of radiation protection, 20:11075 (R;IT;In Italian)

Energiministeriet, Copenhagen (Denmark)
Report from the governmental committee on political strategies related to electric power, 20:10107 (R;DK;In Danish)

Energistyrelsen, Copenhagen (Denmark)
Development and initiatives within the field of energy. Note on status 1994, 20:10149 (R;DK;In Danish)

Energoprojekt-Warszawa, Warsaw (Poland)
Air pollution monitoring around big combustion power plants on the example of Belchatow Power Plant, 20:9233 (IA;PL;In Polish)
Investigations of the influence of fossil-fuel power plants on environments from view points of air pollution, 20:9231 (IA;PL;In Polish)
The analysis of the Belchatow Power Plant influence on radiological situation of environment. Assessment of measurements hitherto and proposals of changes, 20:11088 (IA;PL;In Polish)
The assessment of the existing measuring system for atmospheric precipitation control around Belchatow power plant and a concept of its changing, 20:9234 (IA;PL;In Polish)
The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant. Symposium. Belchatow 29-30 April 1993, 20:9230 (I;PL;In Polish)
The impact of pollutants emitted by Power Plant Belchatow on the forest ecosystems around Belchatow. The state and research perspectives, 20:9235 (IA;PL;In Polish)
The influence of Belchatow power plant on environment on the base of hitherto measurements and research, 20:9232 (IA;PL;In Polish)
The modern model of transport of air pollutants originating from high energetic emitters, 20:9237 (IA;PL;In Polish)
The study of trace elements emission by Belchatow Power Plant. The concept of changes in measurement systems, 20:9236 (IA;PL;In Polish)

Energy and Environmental Analysis, Inc., Arlington, VA (United States)
Development of a gas information system (GASIS). Quarterly report, September–November, 1994, 20:9314 (R;US)

Environmental Protection Agency, Washington, DC (United States)
Office of radiation and indoor air: Program description, 20:9407 (R;US)

Environmental Protection Agency, Washington, DC (United States). Hazardous Site Evaluation Div.
Guidance for performing site inspections under CERCLA, 20:9409 (R;US)

Environmental Protection Agency, Washington, DC (United States). Office of Solid Waste
Compendium of ORD and OSWER documents relevant to RCRA corrective action, 20:9408 (R;US)

Environmental Science Associates, Inc., San Francisco, CA (United States)
Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS: Executive summary, 20:9882 (R;US)

Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS, Volume 1 of 2, 20:9883 (R;US)
Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS, Volume 2 of 2: Appendices, 20:9884 (R;US)
Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Final EIR/EIS, 20:9886 (R;US)

Esbensen Raadgivende Civilingenioerer, Virum (Denmark)
The Danish daylighting programme, 20:10226 (R;DK)

Exploration Resources, Inc., Athens, GA (United States)
The Savannah River Site's Groundwater Monitoring Program. Second quarter 1994, 20:9411 (R;US)

F

Federal Energy Management Program, Washington, DC (United States)
FEMP, Federal Energy Management Program: Focus. Volume 3, No. 4, 20:10192 (R;US)

Fermi National Accelerator Lab., Batavia, IL (United States)
132 ns Bunch Spacing in the Tevatron Proton-Antiproton Collider, 20:10623 (R;US)
A study of parton distribution functions with the use of photon + jet event kinematics in $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV, 20:11361 (R;US)
Accelerating D&D at Fernald: The fast track remediation design/bid package, 20:9735 (R;US)
B-Physics results from D0, 20:11363 (R;US)
Cosmic ray test results of the DO prototype scintillating fiber tracker, 20:10689 (R;US)
Coupling in the Tevatron, 20:10622 (R;US)
Excited Charm States, 20:11396 (R;US)
Measurement of the D0 WAMUS magnet inductance, 20:10641 (R;US)
Orbit analysis, 20:10621 (R;US)
Preliminary results on the decays $D^+ \rightarrow K^+\pi^+\pi^-$, $D^+ \rightarrow K^+K^+K^+$, 20:11362 (R;US)
Report III on Switchyard beam position monitor, 20:10639 (R;US)
Search for SUSY at CDF, 20:11300 (R;US)
Statistical data analysis, 20:10638 (R;US)
Studies of kinematic distributions and mass reconstruction of CDF top candidate events, 20:11395 (R;US)
SVX II a silicon vertex detector for run II of the tevatron, 20:10687 (R;US)
Test beam results of a low-pressure micro-strip gas chamber with a secondary-electron emitter, 20:10637 (R;US)
The CDF upgrade, 20:10688 (R;US)
The effect of beam intensity on the estimation bias of beam position, 20:10640 (R;US)
The KTeV Pure CsI Calorimeter, 20:11301 (R;US)
The Tevatron Hadron Collider: A short history, 20:10607 (R;US)

Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)
Radiological release criteria at the Fernald Environmental Management Project theory and practice, 20:9413 (R;US)

Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project
A change in strategy for a CERCLA Removal Action Demolition Project in progress results in overall project enhancements, 20:9733 (R;US)
Celebrating success at Fernald, 20:9734 (R;US)
DOE's perspective: Reaching success by standing on a three legged stool, 20:10119 (R;US)
Fernald waste management and disposition, 20:9414 (R;US)
Low level waste shipment accident lessons learned, 20:9340 (R;US)
Rail transportation of Fernald remediation waste, 20:9339 (R;US)
Technology development and applications at Fernald, 20:9736 (R;US)
The task force process, 20:10144 (R;US)
Utilization of a hydraulic barrier to control migration of a uranium plume, 20:9732 (R;US)

Finnish Association for Aerosol Research, Espoo (Finland)
Effects of nitric acid vapor on the formation of cloud droplets in troposphere, 20:10815 (R;FI;In Finnish)

Fish and Wildlife Service, Portland, OR (United States). Columbia River Field Station
Significance of selective predation and development of prey protection measures for juvenile salmonids in the Columbia and Snake River reservoirs. Annual progress report, February 1991–February 1992, 20:9857 (R;US)

Fjaerrvaermeutveckling FVU AB, Nykoeping (Sweden)
Evacuated powder insulation for district heating applications, 20:10271 (R;SE)

Florida Univ., Gainesville, FL (United States)
A comprehensive program to develop correlations for the physical properties of Kraft black liquor. Interim report No. 3, 20:10244 (R;US)

FORCE Insts., Copenhagen (Denmark)
In-situ calibration of large heat meters in district heating plants by means of radioisotope flow measuring methods, 20:9821 (R;DK;In Danish)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie 1 - Nuklearchemie
Progress report on nuclear data research in the Federal Republic of Germany for the period April 1, 1992 to March 31, 1993, 20:11407 (R;DE)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie und Dynamik der Geosphaere 3: Atmosphaerische Chemie
A comparison of measured OH concentrations with model calculations, 20:10830 (R;DE)
A supplement for the RADM2 chemical mechanism: The photooxidation of isoprene, 20:10828 (R;DE)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie und Dynamik der Geosphaere 4: Erdoel und Organische Chemie
Changes in the organic matter in the weathered zone above a petroleum bedrock, 20:9274 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Festkoerperforschung
Preparation and characterization of epitaxial high temperature superconductor layers, 20:11773 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Plasmaphysik
Development of a FE method for modelling plasma flows in tokamak plasma edges, 20:11861 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Schicht- und Ionentechnik
Charge transport and recombination investigations in hydrogenated amorphous silicon (a:Si:H) pin diodes by its forward current mode, 20:10581 (R;DE;In German)
Examination of superconductor-semiconductor hybrid devices in the niob/silicon system, 20:10580 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik
Experimental investigations of graphite corrosion and aerosol formation during air ingress into the core of a high temperature pebble bed reactor, 20:10090 (R;DE;In German)
Investigations of adsorption and desorption ob mercury and mercury(II)chloride on rhenish lignite coke, 20:10829 (R;DE;In German)
Modelling of subcooled boiling in ATHLET and application in water cooled research reactors, 20:10074 (R;DE;In German)
On the selfacting safe limitation of fission power and fuel temperature in innovative nuclear reactors, 20:10091 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Werkstoffe der Energietechnik
Corrosion behaviour of coat-mix-SiC-filter under simulated conditions of soot filtration, 20:10285 (R;DE;In German)
Crack growth in the pm nickel-base superalloy N18 in the temperature range between 400 and 750 C under static and cyclic loading, 20:10329 (R;DE;In German)
Inelastic analysis of the deformation behaviour of internally cooled IN 738 LC turbine blades using the microstructural dependent constitutive equations, 20:10328 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Zentralinstitut fuer Angewandte Mathematik
Parallel algorithms and tools for matching functional and anatomical data on the basis of PET and MRT volume data, 20:10991 (R;DE;In German)

Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Kern- und Hadronenphysik
Tilted cranking, 20:11409 (R;DE)

Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Nukleare Sicherheit
Analysis of transients for NPP with VVER-440 using the code SiTAP, 20:10084 (R;DE)

Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany)
Interplay of collective flow phenomena and velocity correlations of intermediate-mass fragments in collisions of Au + Au at E = 100 - 400A.MeV, 20:11607 (R;DE)
Pushing and cranking corrections to the Meson fields of the bosonized Nambu and Jona-Lasinio model, 20:11323 (R;DE)
Resonance phenomena at high level density, 20:11410 (R;DE)
Velocity correlations of intermediate mass fragments produced in central collisions of Au + Au at E = 150 A.MeV, 20:11608 (R;DE)

Fossil Energy Research Corp., Laguna Hills, CA (United States)
Integrated dry NO_x/SO_2 emissions control system calcium-based dry sorbent injection. Test report, April 30–November 2, 1993, 20:9940 (R;US)

Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU), Garmisch-Partenkirchen (Germany)
Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU). Annual report 1992, 20:10812 (I;DE;In German)

Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany)
Characterisation of machined high-strength ceramic components. Final report, 20:10555 (R;DE;In German)

Fuel Cell Engineering Corp., Danbury, CT (United States)
Molten Carbonate Fuel Cell (MCFC) Product Development Test. Second annual report, 20:10205 (R;US)

Fuel Cell Seminar Organizing Committee (United States)
1990 fuel cell seminar: Program and abstracts, 20:10204 (R;US)

Fundacao de Estudos Agrarios Luiz de Queiroz, Piracicaba, SP (Brazil)
Dynamic of N fertilizers: urea (^{15} N) and aqua ammonia (^{15} N) incorporated to the sugar cane soil. Final report, 20:11028 (R;BR;In Portuguese)

G

Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Dept.
Pipeline corridors through wetlands - impacts on plant communities: Cassadaga Creek Tributary Crossing, Gerry Township, Chautauqua County, New York. Topical report, August 1992–November 1993, 20:9317 (R;US)
Pipeline corridors through wetlands - summary of seventeen plant-community studies at ten wetland crossings. Topical report, February 1990–August 1994, 20:9319 (R;US)

Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Group
Pipeline Corridors through wetlands – Impacts on plant communities: Mill Creek Tributary Crossing, Jefferson County, New York, 1992 Survey, 20:9322 (R;US)

General Accounting Office, Washington, DC (United States)
Nuclear nonproliferation and safety: Challenges facing the International Atomic Energy Agency, 20:10298 (R;US)

General Atomics, San Diego, CA (United States)
Effect of toroidal plasma flow and flow shear on global MHD modes, 20:11795 (R;US)
Fluctuations in high β_p plasmas in DIII-D, 20:11828 (R;US)
Pumping characteristics of a cryopump with Ar sorbent in He and in D_2/He mixture, 20:11837 (R;US)

Genetics Society of America, Bethesda, MD (United States)
Genetics and the unity of biology, 20:10955 (R;CA)

Geological Survey, Denver, CO (United States)
Hydrochemical data base for the Death Valley Region, California and Nevada, 20:9492 (R;US)
Precision and accuracy of manual water-level measurements taken in the Yucca Mountain Area, Nye County, Nevada, 1988–90, 20:9494 (R;US)
Revised potentiometric-surface map, Yucca Mountain and vicinity, Nevada, 20:9493 (R;US)

Geological Survey, Salt Lake City, UT (United States)
Increased oil production and reserves from improved completion techniques in the Bluebell Field, Uinta Basin, Utah. Fourth quarterly technical progress report, July 1, 1994–september 30, 1994, 20:9283 (R;US)

Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany)
Calculation of the phase difference speed of water and steam in channels with different geometric borders/edges, 20:10544 (R;DE;In German)

Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany)
Annual report on reactor safety research projects sponsored by the Ministry for Research and Technology of the Federal Republic of Germany. Reporting period 1993. Progress report, 20:10085 (R;DE)

Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)
β-decay of ^{37}Ca, 20:11538 (R;DE)
π-πscattering lengths at finite temperature, 20:11364 (R;DE)
Analysis of native cellular DNA after heavy ion irradiation: DNA double-strand breaks in CHO-K1 cells, 20:11080 (R;DE)
Baryon resonances - a primary $\rho \rightarrow l^+l^-$ source in p+p and p+d at 4.9GeV, 20:11365 (R;DE)
Bose-Einstein correlations of unstable particles, 20:11609 (R;DE)
Chaos in axially symmetric nuclear potential with diffuse surface and spin-orbit coupling, 20:11412 (R;DE)
Coherent Bremsstrahlung emission in the early stage of relativistic heavy ion collisions, 20:11613 (R;DE)
Cold-target recoil-ion momentum-spectroscopy: First results and future perspectives of a novel high resolution technique for the investigation of collision induced many-particle reactions, 20:10691 (R;DE)
Detection of heavy ion induced DNA double-strand breaks using static-field gel electrophoresis, 20:11081 (R;DE)
Experiments on e^+e^--line emissions in HI collisions, 20:11702 (R;DE)
Experiments with relativistic exotic nuclei at the FRS, 20:11605 (R;DE)
Gamow-Teller strength distribution in the beta-decay of ^{100}Ag from total-absorption gamma spectrometry, 20:11411 (R;DE)
Gamow-Teller strength in the β-decay of ^{36}Ca, 20:11539 (R;DE)
Gamow-Teller strength in the beta-decay of ^{37}Ca and its implications for the detection of the solar neutrino flux, 20:11535 (R;DE)
Heavy quark production in pp collisions, 20:11367 (R;DE)
High energy density in matter produced by heavy ion beams. Annual report 1993, 20:11796 (R;DE)
Hydrodynamic evolution of chirally symmetric nuclear matter, 20:11413 (R;DE)
Instanton content of finite temperature QCD matter, 20:11324 (R;DE)
Intensity measurements of slowly extracted heavy ion beams from the SIS, 20:10681 (R;DE)
LET-effects in DNA, 20:11079 (R;DE)
Longitudinal and transverse momentum distributions of ^{9}Li fragments from break-up of ^{11}Li, 20:11616 (R;DE)
Low-energy electrons and their dynamical correlation with the recoil-ions for single ionization of helium by fast, heavy-ion impact, 20:11703 (R;DE)
Multidimensional analysis of collective sidewards flow in Au on Au reactions between 100 and 1050 A MeV, 20:11611 (R;DE)
On the role of dissipation in the early stage of relativistic heavy ion collisions, 20:11615 (R;DE)
Pion production in nucleus-nucleus collisions at intermediate energies, 20:11610 (R;DE)
Production and decay of ^{269}110, 20:11537 (R;DE)

Quark exchange model for charmonium dissociation in hot hadronic matter, 20:11366 (R;DE)
Recent experiments on proton, alpha and cluster radioactivity, 20:11536 (R;DE)
Separation of actinide-made transurania by a gas-filled magnetic separator, 20:9804 (R;DE)
Space charge dominated beam transport, 20:10624 (R;DE)
Spontaneous-fission half-lives of deformed superheavy nuclei, 20:11612 (R;DE)
Study of the unstable nucleus ^{10}Li in stripping reactions of the radioactive projectiles ^{11}Be and ^{11}Li, 20:11617 (R;DE)
The new element 111, 20:11540 (R;DE)
Thermal photon production in heavy ion collisions, 20:11614 (R;DE)
X-ray spectroscopy of highly-charged ions in a storage ring. Invited lecture, 20:10690 (R;DE)

Giessen Univ. (Germany)
Examination of superconductor-semiconductor hybrid devices in the niob/silicon system, 20:10580 (R;DE;In German)

GKSS-Forschungszentrum Geesthacht GmbH (Germnay)
Combined process of gas permeation and condensation for separation and recovery of organic vapours from off-gas streams, 20:10481 (R;DE;In German)
Fracture toughness properties of similar and dissimilar electron beam welds, 20:10320 (R;DE;In German)
Phase formation during mechanical alloying in the systems Cu-Co and Cu-Fe, 20:10319 (R;DE;In German)

Goias Univ., Goiania, GO (Brazil)
Psycho-social impact of the cesium-137 accident in the Brazilian society, 20:10177 (I;BR;In Portuguese)

Golder Associates, Inc., Richland, WA (United States)
Qualitative risk assessment for the 100-HR-3 groundwater operable unit, 20:9763 (R;US)

Gordon Research Conferences, Inc., Kingston, RI (United States)
The Gordon conference on mammalian DNA repair, 20:10957 (R;US)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.
Intermediate efficiency BGO-detector for time-of-flight capture cross-section measurements, 20:10686 (R;RU)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij
A compact expression for bilinear combination of Dirac spinors via world tensors, 20:11302 (R;RU)
Anomalous di-photon production at LEP: possible consequences at FNAL hadron collider, 20:11380 (R;RU)
B_c-meson production in hadron-hadron collisions, 20:11378 (R;RU)
Do the narrow cryptoexotic baryon resonances exist ?, 20:11398 (R;RU)
Double charmed baryons production at B-factory, 20:11399 (R;RU)
Four heavy quark and bound state production in the $e^+e^- \rightarrow$ Q + Q-bar$'$ + Q$'$ + Q-bar and $e^+e^- \rightarrow$ (QQ-bar$'$) + Q$'$ + Q-bar processes in Z^0-boson pole, 20:11371 (R;RU)
Hadronic production of B_c-mesons, 20:11376 (R;RU)
Hamiltonian formulation of two body problem in Wheeler-Feynman electrodynamics, 20:11325 (R;RU)
Integrative shell of the program complex MARS (Version 1.0) radiation transfer in three-dimensional geometries, 20:11683 (R;RU;In Russian)
Local solutions of harmonical and Bi-harmonical equations, universal field equation and self-dual configurations of Yang-Mills fields in four dimensions, 20:11303 (R;RU)
Method of light collection in scintillator calorimeters, 20:10692 (R;RU)
On drawing complicated 3D surfaces, 20:11304 (R;RU)
On possibility to study neutrino oscillations by detectors located at Gran Sasso (Italy) using beams from 600 GeV UNK-1 machine, 20:11375 (R;RU)
On the search for exotic hadrons in the experiments with high energy hyperon beam, 20:11373 (R;RU)
Period doubling dynamics in hadron physics: exact calculations, 20:11374 (R;RU)
Scaling behaviour of leptonic decay constants for heavy quarkonia and heavy mesons, 20:11379 (R;RU)
Scaling law for the Υ(4S) $\rightarrow$ BB-bar and ψ(3770) $\rightarrow$ DD-bar decay constants from effective sum rules, 20:11370 (R;RU)
Search for heavy pentaquark exotic baryons with hidden strangeness in the reactions p + N $\rightarrow$ (pϕ) + N and p + N $\rightarrow$ [Λ(1520)K$^+$] + N at E_p = 70 GeV, 20:11397 (R;RU)
Search for N_ϕ(1960) baryon, 20:11400 (R;RU)
Study of different type neutrino oscillations based on neutrino beams from 600 GeV, 20:11369 (R;RU;In Russian)
Study of electromagnetic calorimeter and shower maximum detector elements with scintillators and wave length shifter optical fibers, 20:10693 (R;RU)
Study of the p + N $\rightarrow$ [Σ^0K$^+$] + N reaction at E_p 70 GeV, 20:11368 (R;RU;In Russian)
Testing vector boson dominance of electroweak interactions via $e^+e^- \rightarrow$ f-barf, 20:11377 (R;RU)
The $\pi \rightarrow e\nu\gamma$ decay in chiral perturbation theory, 20:11372 (R;RU)
Universal geometrical module for MARS program, 20:11922 (R;RU;In Russian)
Using data bases for geometry description in problems of radiation transport simulation, 20:11684 (R;RU;In Russian)

Greenpeace e.V., Hamburg (Germany)
Dioxin factories. A study on the formation and dispersion of dioxins and other organic compounds of chlorine in PVC production, 20:10143 (I;DE;In German)

Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules Elementaires
LEP asymmetries and fits of the standard model, 20:11387 (R;FR)
Neutrino oscillation at reactors, 20:11401 (R;FR)

GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Braunschweig (Germany). Inst. fuer Tieflagerung
Contributions to surface rock mechanics at the Asse southern flank, 20:9416 (R;DE)

Nuclear measurements, techniques and instrumentation industrial applications plasma physics and nuclear fusion, 1980-1993. International Atomic Energy Agency publications, 20:11894 (I;XA)
Project and supply agreement. The text of the agreement of 15 January 1993 between the International Atomic Energy Agency and the Government of the Republic of Indonesia and the Government of the United States of America concerning the transfer of enriched uranium for the fabrication of targets for the production of radioisotopes for medical purposes, 20:11968 (R;XA;In Arabic, Chinese, English, French)
Project and supply agreement. The text of the agreement of 15 January 1993 between the International Atomic Energy Agency and the Government of the Republic of Indonesia and the Government of the United States of America concerning the transfer of enriched uranium for materials test reactor fuel development, 20:11969 (R;XA;In Arabic, Chinese, English, French)
Project and supply agreement. The text of the agreement of 17 June 1993 between the International Atomic Energy Agency and the governments of Colombia and the United States of America concerning the transfer of enriched uranium for a research reactor, 20:11972 (R;XA;In Arabic, Chinese, English, French)
R and D on accelerator-based transmutation at JAERI, 20:9421 (IA;XA)
Resolution of nuclear energy issues using accelerator-driven technology, 20:9420 (IA;XA)
Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992, 20:10026 (R;XA)
Safety assessment of computerized control and protection systems, 20:10028 (RA;XA)
Special scientific programme on use of high energy accelerators for transmutation of actinides and power production, 20:9418 (I;XA)
Statement, dated 8 December 1994, by the presidency on behalf of the European Union on the accession of Ukraine to the treaty on the non-proliferation of nuclear weapons, 20:10296 (R;XA;In Arabic, Chinese, English, French)
Text of an African regional co-operative agreement for research, development and training related to nuclear science and technology, 20:11966 (R;XA;In Arabic, Chinese, English, French)
The financial regulations of the Agency, 20:11961 (R;XA;In Arabic, Chinese, English, French)
The Members of the Agency, 20:11960 (R;XA;In Arabic, Chinese, English, French)
The physical protection of nuclear material, 20:9797 (R;XA;In Arabic, Chinese, English, French)

The role of dynamic testing in the certification of software based safety critical systems, 20:10029 (RA;XA)
The text of the agreement to extend the regional co-operative agreement for research, development and training related to Nuclear Science and Technology, 1987. Status of acceptances as of July 1994, 20:11963 (R;XA;In Arabic, Chinese, English, French)
The text of the safeguards transfer agreement relating to the bilateral agreement between Spain and the United States of America, 20:9796 (R;XA;In Chinese, English, French, Russia)
The texts of the instruments concerning the Agency's assistance to Indonesia for the continuation of a research reactor project, 20:11962 (R;XA;In Arabic, Chinese, English, French)
The withdrawal of the Democratic People's Republic of Korea from the International Atomic Energy Agency, 20:11967 (R;XA;In Arabic, Chinese, English, French)
Transmutation of long-lived radionuclides: Requirements for and review of technical possibilities, 20:9419 (IA;XA)
Use of proton accelerators for transmutation of actinides and power production, 20:10602 (IA;XA)
[High energy particle accelerators for bulk transformation of elements and energy generation], 20:10601 (IA;XA)

International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee

Absolute gamma branching ratios for fission products in the mass range 74-165, 20:11570 (R;XA)
The global optical potentials and neutron - Nucleus scattering data, 20:11622 (R;XA)

International Development and Resources, Inc., Falls Church, VA (United States)

Iraqi nuclear weapons development program. Final report, October 1, 1992–September 30, 1993, 20:10300 (R;US)

International Inst. for Applied Systems Analysis, Laxenburg (Austria)

Production costing simulation in thermal power systems using the mixture of conditional load distribution functions. Working paper, 20:11953 (R;AT)
User's guide to CO2DB: The IIASA CO_2 technology data bank. Version 1.0, 20:11954 (R;AT)
USSR energy efficiency and prospects, 20:10123 (R;AT)

International Society for Plant Molecular Biology, Tucson, AZ (United States)

Third international congress of plant molecular biology: Molecular biology of plant growth and development, 20:10956 (R;US)

Iowa State Univ. of Science and Technology, Ames, IA (United States)

Development of a gas-promoted oil agglomeration process. Technical progress report, October 1, 1994–December 31, 1994, 20:9203 (R;US)
Pressure fluctuations as a diagnostic tool for fluidized beds. Technical progress report, October 1, 1994–December 31, 1994, 20:9264 (R;US)

Isotopentechnik DR Sauerwein GmbH, Haan (Germany)

Manipulator-controlled manufacturing and on-line testing of composite materials. Subproject: Development and trial of test techniques. Final report, 20:10556 (R;DE;In German)

Israel Nuclear Society, Yavne (Israel)

A correlation of the fission product yields of different isotopes, 20:11623 (RA;IL)
A one-dimensional model for scoping studies of measures to reduce damage rate to PWR pressure vessels, 20:9970 (RA;IL)
AP600 post blowdown containment transients, 20:9966 (RA;IL)
Automatic control rod programming for boiling water reactors, 20:9950 (RA;IL)
Calculation of doppler coefficient of reactivity by WIMS code, 20:9969 (RA;IL)
Classification of nuclear power plants transients using the probabilistic neural networks which 'knows' when it does not know, 20:10034 (RA;IL)
Energy production in a thorium subcritical lattice driven by accelerated protons, 20:10067 (RA;IL)
Environmental risk assessment of radioactive sources and materials used in industry research and medicine, 20:9825 (RA;IL)
Evaluation of temperature distribution in a nuclear fuel with cladding detachment, 20:10483 (RA;IL)
Fast dynamic neutron sources based on the (γ,n) reactions, 20:9802 (RA;IL)
Feynman-alpha measurements at Ben-Gurion University's subcritical assembly, 20:10068 (RA;IL)
Full core simulation of Loss of Coolant transients in an AP600 reactor using COBRA, 20:9964 (RA;IL)
Increasing the moderating ratio for plutonium burning in PWR, 20:9968 (RA;IL)
Investigation of a practical method of output factor determination for small and irregular electron beams, 20:9820 (RA;IL)
Ion implantation induced microstructural damage in a nuclear waste glass, 20:10401 (RA;IL)
IRR-1 moderator temperature coefficient of reactivity at two different core configurations, 20:10069 (RA;IL)
Leakage prediction in nuclear power plants using similarity formulae and genetic algorithms, 20:9967 (RA;IL)
Measurement systems Optimal calibration and input restoration using apriory information, 20:9819 (RA;IL)
Modifying SCALE-4.1 for transmutation calculations, 20:9423 (RA;IL)
Neutron activation analysis for environmental trace element research Determination of aluminium in drinking water, 20:10449 (RA;IL)
Non-probabilistic reliability of structures, 20:10513 (RA;IL)
Nuclear power in Europe: status, safety, issues in a regulators trends, 20:10179 (RA;IL)
Nuclear steam generators, 20:9949 (RA;IL)
Occupational exposure of diagnostic radiology staff, 20:11096 (RA;IL)
Optimal thermal-hydraulic design for the highly moderated mixed oxides fueled pressurized water reactor, 20:9971 (RA;IL)
Prenatal x-ray exposure, cosmic radiation and unwarranted pregnancy termination, 20:11095 (RA;IL)
Production of no-carrier added ^{73}Se and ^{75}Se via the ^{75}As(p,3n) and ^{75}As(p,n) reactions using Cu_3As alloy as a high current target material Thermochromatographic separation of radioselenium from irradiated Cu_3As-target, 20:9805 (RA;IL)
Protection of the patient in diagnostic and therapeutic radiology the approach of national and international organizations and consequences for Israel, 20:10988 (RA;IL)
Radionuclide angiography for the assessment of pulmonary pulsatile blood volume changes, 20:10990 (RA;IL)
Reactivity effects from voiding the fuel and control channels in RBMK as computed by a detailed three- dimensional model, 20:9975 (RA;IL)
Representing the in core fuel management as a large-space search problem, 20:9946 (RA;IL)
Rewetting of a finite rod an arbitrary space-dependent heat transfer coefficient, 20:10017 (RA;IL)
Survey of occupational exposure involved in medical and industrial uses of radiation in Israel, 1981-1993, 20:11094 (RA;IL)
Temperature dependent free gas scattering kernels for strongly varying scattering cross sections, 20:11687 (RA;IL)
The axial distribution of reactivity coefficients, 20:9965 (RA;IL)
The BGO alpha-beta-gamma scintillation spectrometer, 20:10698 (RA;IL)
The impact of neutron irradiation on the mechanical properties and fracture morphology of cold worked aluminium-6063, 20:10322 (RA;IL)
The measuring of the fading of CaF_2:Tm TLDs by computerized glow curve deconvolution and manual analysis, 20:11097 (RA;IL)
The necessity of quality assurance and quality management programs in diagnostic and therapeutic radiology a review of some abnormal occurrences in the USA, 20:10987 (RA;IL)
The radiological accident in Goiania A safety culture problem, 20:11093 (RA;IL)
The use of software quality assurance techniques in the validation of results in nuclear thermal-hydraulic safety research, 20:10000 (RA;IL)
Thyroid status of children immigrating from the vicinity of Chernobylsk, 20:11098 (RA;IL)
Transactions of the nuclear societies of Israel joint meeting 1994, 20:10873 (R;IL)
Transient focal alopecia following radiosurgery, 20:10989 (RA;IL)

Trends in the applications of artificial neural networks in the nuclear industry, 20:10033 (RA;IL)
Updating linear elastic models based on computational selective sensitivity, 20:10514 (RA;IL)
Validation of RELAP5 critical flow model, 20:10548 (RA;IL)
Water quality control determination of gross alpha and gross beta radioactivity in drinking water in Israel, 20:10938 (RA;IL)

6. Trilateral German-Russian-Ukrainian seminar on high-temperature superconductivity. General information. Program. Abstracts. List of participants, 20:11735 (I;RU)

Anomalous temperature dependence of the electromagnetic penetration depth in $Y_1Ba_2Cu_3O_{7-x}$ single crystals, 20:11747 (IA;RU)

Atomic structure of Tl-2212 single crystals before and after the transition to the superconducting state, 20:10326 (IA;RU)

Barium NQR and NMR in high-T_c superconductors, 20:11755 (IA;RU)

Bi-1212, a competitor of YBCO-123, 20:10366 (IA;RU)

Changes in depth profiles of oxygen and copper in Y-Ba-Cu-O film under annealing, 20:10375 (IA;RU)

Coupled vortex diffusion in macroscopically inhomogeneous superconductors, 20:11750 (IA;RU)

Critical fluctuation phenomena in the resistivity and the Hall effect of HTSC near T_c in strong magnetic fields, 20:11762 (IA;RU)

Critical state of flat superconductors in perpendicular magnetic field, 20:11738 (IA;RU)

Defect chemistry of BSCCO and its high temperature conductivity, 20:10372 (IA;RU)

Doping dependence and orbital character of electronic states in HTSC's, 20:11744 (IA;RU)

Effect of light illumination on spectral and current-carrying properties of Y-Ba-Cu-O superconductive films, 20:11770 (IA;RU)

Effect of microstructure on the ortho-to-tetra phase transition parameters in $YBa_2Cu_3O_{7-x}$ compound, 20:11768 (IA;RU)

Effect of vortex fluctuations on Tl spin-lattice relaxation in the mixed state of $Tl_2Ba_2CuO_6$, 20:11749 (IA;RU)

Electric field effect in superconductors, 20:11746 (IA;RU)

Features of Sc - doped 1-2-3 ceramics, 20:10376 (IA;RU)

Femtosecond optical spectroscopy of relaxation processes in fullerenes and fillerites, 20:11706 (IA;RU)

Femtosecond spectroscopy of Y-$Ba_2Cu_3O_{7-\delta}$: electron-phonon interaction measurement and energy gap observation, 20:11758 (IA;RU)

Flame fission between 800 and 2500 deg C, 20:10371 (IA;RU)

Freeze - drying method of 2223 bismuth ceramics preparation, 20:10370 (IA;RU)

Fullerenes and superconductivity, 20:10404 (IA;RU)

Growth mechanisms, microstructures and superconducting transport properties of deposited HTSC materials, 20:11736 (IA;RU)

Growth of superconducting Bi-Sr-Ca-Cu-O whiskers from amorphous precursors, 20:10368 (IA;RU)

High-T_c superconductors viewed as strongly correlated electron systems, 20:11759 (IA;RU)

Improved magnetron sputter deposition and critical properties of large-area $YBa_2Cu_3O_{7-\delta}$ thin films, 20:10363 (IA;RU)

Individual magnetic vortex ring excitation: universal features of exact solution, 20:11751 (IA;RU)

Inelastic neutron scattering and antiferromagnetic fluctuations HTSC, 20:11740 (IA;RU)

Influence of oxygen pressure and substrate surface on the laser ablation deposition process of YBaCuO superconducting thin films, 20:10369 (IA;RU)

Instability at high flux-flow velocities in a high-temperature superconductor, 20:11737 (IA;RU)

Intrinsic Josephson effects in layered superconductors, 20:11739 (IA;RU)

Investigation of spatial and time dependences of S-N-S high T_c film microdetector response by laser scanning, 20:11764 (IA;RU)

Josephson junctions on chemically etched edges of $YBa_2Cu_3O_{7-x}$, 20:10360 (IA;RU)

Lattice dynamics of HTSC, 20:11743 (IA;RU)

Microwave surface resistance of YBCO films in magnetic field, 20:11765 (IA;RU)

Monte Carlo simulations of the melting transition of an Abrikosov vortex lattice, 20:11771 (IA;RU)

Morphology and structure of BiSrCaCuO whiskers, 20:10373 (IA;RU)

Muon spin rotation spectroscopy of high temperature superconductors, 20:11742 (IA;RU)

Neutron polarization investigations of high temperature superconductors, 20:11754 (IA;RU)

Novel method of the longlength current carrying HTSC structures formation, 20:10367 (IA;RU)

On the anomalous concentrational dependencies of critical temperature and isotope effect parameter in the high-temperature superconductors, 20:10361 (IA;RU)

On the linear negative magnetoresistance high-T_c superconducting crystals, 20:11761 (IA;RU)

On the structure of the superconducting ortho-II phase of $YBa_2Cu_3O_{6.51}$, 20:11769 (IA;RU)

Orientational ordering phase transitions in C70 crystal at high pressure, 20:10407 (IA;RU)

Oxygen isotope effect in T_c of $La_{2-y}Sr_yCu_{1-x}Me_xO_4$ (y=0.15; 0.20; Me=Ni, Zn, Co, Fe), 20:10364 (IA;RU)

Peculiarities of low temperature specific-heat of pure and weakly doped fullerites, 20:10408 (IA;RU)

Penetration depth in Rb_3C_{60} and Ginsburg numbers of superconducting fullerites, 20:11766 (IA;RU)

Phase separation in oxygen-deficient $RBa_2Cu_3O_x$ compounds as it is seen from the magnetic resonance of rare-earth ions, 20:11756 (IA;RU)

Photoinduced transitions 0.1-0.6 eV in oxygen-doped La_2CuO_{4+x} single crystals, 20:10365 (IA;RU)

Proximity effect in superconductor-antiferromagnetic structures, 20:11752 (IA;RU)

Quasi-independent subsystems in HTSC: temperature redistribution of holes seen by optical absorption, 20:11745 (IA;RU)

Redox reactions of CuO in BaO/CuO mixtures, their effects on the phase relations and the formation of $YBa_2Cu_3O_{7-x}$, 20:10374 (IA;RU)

Single-phase superconducting Bi2Sr2Ca1Cu2Oy films on the (Y, Nd)AlO3 substrata, 20:10406 (IA;RU)

Statistical mechanics of vortex system in two-dimensional superconductor, 20:11763 (IA;RU)

Structural aspects of high-T_c superconductors from neutron diffraction studies, 20:11741 (IA;RU)

Advanced sulfur control concepts for hot-gas desulfurization technology. Quarterly report, July–September 1994, 20:9206 (R;US)

Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States)
A case study on determining air monitoring requirements in a radioactive materials handling area, 20:11069 (R;US)
Calibration and operation of continuous air monitors for alpha-emitting radionuclides, 20:11067 (R;US)
Dissolution rate and radiation dosimetry of metal tritides, 20:11068 (R;US)
Nuclear magnetic resonance studies of granular flows. Quarterly technical progress report, July 1994–September 1994, 20:10432 (R;US)

Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst.
Inhalation Toxicology Research Institute annual report, October 1, 1993–September 30, 1994, 20:10823 (R;US)
Species differences in metabolism of 1,3-butadiene, 20:10963 (R;US)

LSR Technologies, Inc., Acton, MA (United States)
Particulate emission abatement for Krakow boiler houses. Technical progress report No. 2, July 1, 1994–September 30, 1994, 20:9228 (R;US)

Lund Univ. (Sweden). Dept. of Fire Safety Engineering
Simulation of combustion and fire-induced flows in enclosures, 20:10504 (R;SE)

Lund Univ. (Sweden). Dept. of Heat and Power Engineering
Evaluation of gas-fueled small-scale cogeneration, 20:9939 (R;SE;In Swedish)
Load management in dwellings. Computer simulations, 20:10225 (R;SE;In Swedish)
System Studies of District Cooling, 20:10272 (R;SE;In Swedish)

Lund Univ. (Sweden). Dept. of Physics
Mapping the structure of rotating nuclei, 20:11533 (R;SE)
Studies of various aspects of the proton structure in deep inelastic scattering at HERA and identification of quark and gluon jets, 20:11333 (R;SE)

M

M-C Power Corp., Burr Ridge, IL (United States)
250-kW power plant construction plan - task 2.4. Topical report, 20:9931 (R;US)

Maine Metal Products Association, Portland, ME (United States)
Environmentally Conscious Manufacturing Project: ECM assessment guidance manual, 20:10242 (R;US)
Federal assistance project status report. Third quarterly report, October 1, 1994–December 31, 1994, 20:10241 (R;US)

Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)
Paducah Gaseous Diffusion Plant Annual Site Environmental Report for 1993, 20:9702 (R;US)
Paducah Gaseous Diffusion Plant Annual Site Environmental Report summary for 1993, 20:9703 (R;US)
Portsmouth Gaseous Diffusion Plant Annual Site Environmental Report summary for 1993, 20:9701 (R;US)
Poster session ELIPGRID-PC, 20:10856 (R;US)

Martin Marietta Energy Systems, Paducah, KY (United States)
Paducah Gaseous Diffusion Plant Annual Site Environmental Report for 1993, 20:9702 (R;US)
Paducah Gaseous Diffusion Plant Annual Site Environmental Report summary for 1993, 20:9703 (R;US)

Maryland Univ., College Park, MD (United States)
Maryland Controlled Fusion Research Program. Progress report, November 1, 1993–October 31, 1994, 20:11785 (R;US)

Maryland Univ., College Park, MD (United States). Dept. of Physics
Theoretical studies in hadronic and nuclear physics. Progress report, December 1, 1993–June 30, 1994, 20:11408 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Program for Advanced Nuclear Power Studies
Improving human reliability through better nuclear power plant system design. Progress report, 20:10082 (R;US)
The dependence of human reliability upon task information content, 20:10083 (R;US)

Massachusetts Univ., Amherst, MA (United States). Dept. of Chemical Engineering
Kinetics and dynamics of oxidation reactions involving adsorbed CO species on bulk supported Pt and copper oxides. Final project report, January 1, 1991–December 31, 1993, 20:10477 (R;US)

Materials Technologies of Virginia, Inc., Blacksburg, VA (United States)
Whisker reinforced glass ceramic. Quarterly progress report No. 1, September 27, 1994–December 27, 1994, 20:10395 (R;US)

Max-Eyth-Gesellschaft fuer Agrartechnik e.V., Darmstadt (Germany)
Thermodynamic optimisation of air collectors of solar dryers, 20:9865 (I;DE;In German)

Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)
Economic efficiency of CO_2 reduction programs, 20:10120 (R;DE)
On the intra-seasonal variability within the extratropics in the ECHAM3 general circulation model, 20:10822 (R;DE)
On the relations between the oceanic uptake of CO_2 and its carbon isotopes, 20:10821 (R;DE)
Statistical downscaling of winter monthly mean North Atlantic sea-level pressure to sea level variations in the Baltic Sea, 20:10814 (R;DE)
Stratospheric climate and variability from a general circulation model and observations. Pt. 1. Results for the December-February season, 20:10813 (R;DE;In German)

Max-Planck-Institut fuer Physik, Muenchen (Germany)
A consistent parametrisation for the production rates of negatively charged hadrons and neutral strange particles in nucleon-nucleon, nucleon-nucleus and nucleus-nucleus collisions, 20:11389 (R;DE)
The hadronic final state in deep inelastic scattering at HERA, 20:11390 (R;DE)

Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut
An investigation of Bose-Einstein correlations in muon-nucleon interactions at 490 GeV, 20:11388 (R;DE)

Max-Planck-Institut fuer Plasmaphysik, Garching (Germany)
ASDEX upgrade results - publications and conference contributions. Period 10/93 to 7/94, 20:11856 (R;DE)
Exact three-dimensional MHD equilibria without continuous symmetries, 20:11800 (R;DE)

Nonexistence of MHD equilibria with poloidally closed field lines in the case of violated axisymmetry, 20:11799 (R;DE)
Pellet injector for diagnostics purposes, 20:11797 (R;DE)
Sensitivity study of a proposed polarimetry diagnostic on ASDEX upgrade, 20:11798 (R;DE)
The low energy neutral particle analyzer (LENA) at W7-AS, 20:11801 (R;DE)

McGill Univ., Montreal, PQ (Canada)
Development of an alternative kraft black liquor recovery process based on low-temperature processing in fluidized beds. Final technical report on Annex 9, Task 1, 20:10245 (R;US)

Melbourne Univ., Parkville, VIC (Australia). School of Physics
Comparison of lead zirconate titanate thin films on ruthenium oxide and platinum electrodes, 20:10389 (R;AU)
Computational simplifications in pion and kaon induced nucleon knock-on reactions, 20:11675 (R;AU)
Doppleron resonances in the diffraction of atoms by an evanescent field, 20:11283 (R;AU)
Inversion of electron-water elastic scattering data, 20:11603 (R;AU)
Quantal inversion of cross-section for the elastic scattering of 200 MeV protons from ^{12}C, 20:11674 (R;AU)
The non-relativistic charged Bose gas in a magnetic field I. Formalism, 20:11775 (R;AU)
Two body potentials from quantal inversion differential cross section data, 20:11604 (R;AU)

Miami Univ., FL (United States). Rosenstiel School of Marine and Atmospheric Sciences
Gulf stream frontal eddy influence on productivity of the southeast U.S. continental shelf, 20:10927 (R;US)

Michigan Technological Univ., Houghton, MI (United States). Dept. of Metallurgical and Materials Engineering
Separation of flue-gas scrubber sludge into marketable products. Second year, first quarterly technical progress report, September 1, 1994–November 30, 1994 (Quarter #5), 20:9941 (R;US)

Michigan Univ., Ann Arbor, MI (United States)
Characterization and modification of fluid conductivity in heterogeneous reservoirs to improve sweep efficiency. Final report, 20:9277 (R;US)
The role of hydrogen in the hydrogenation and hydrogenolysis of aniline on the nickel single crystal surfaces: Its implication on the mechanisms of HDN reactions, 20:10471 (R;US)
[Hydrogen induced C-C, C-N, and C-S bond activities on Pi and Ni surfaces]: Summary, 20:10478 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemical Engineering
Biological determinants of photobioreactor design. 6th Quarterly report, October 1994–December 1994, 20:9834 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemistry
Aniline hydrogenolysis on the Pt(111) single crystal surface: Mechanisms for C-N bond activation, 20:9290 (R;US)

Miljoeministeriet, Copenhagen (Denmark)
Report from the governmental committee on political strategies related to electric power, 20:10107 (R;DK;In Danish)

Miljoestyrelsen, Copenhagen (Denmark)
Disposal of slightly polluted soils. 1: Evaluation of oil and gasoline polluted soils, 20:10888 (R;DK;In Danish)
Disposal of slightly polluted soils. 2: Evaluation of soils polluted by gas utilities, 20:10889 (R;DK;In Danish)
Disposal of slightly polluted soils. 3: Evaluation of soils polluted by heavy metals, 20:10890 (R;DK;In Danish)

Ministere de l'Industrie, des Postes et Telecommunications et du Commerce Exterieur, 75-Paris (France). Direction de la Surete des Installations Nucleaires
Activity report 1992, 20:11884 (R;FR;In French)
Activity report 1993, 20:11885 (R;FR;In French)

Ministerium fuer Wirtschaft, Mittelstand und Technologie des Landes Nordrhein-Westfalen, Duesseldorf (Germany)
Wind power in low-wind regions. Construction and operation of medium-capacity wind power plants - economic, technical and legal aspects. Practical manual, 20:9893 (I;DE;In German)

Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemical Engineering and Materials Science
Modeling of the simulated countercurrent moving-bed chromatographic reactor used for the oxidative coupling of methane, 20:9854 (R;US)

Mississippi State Univ., MS (United States)
Non-coincident multi-wavelength emission absorption spectroscopy, 20:10202 (R;US)

Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab.
Application of modern diagnostic methods to environmental improvement. Annual progress report, January–October 1994, 20:10808 (R;US)
Development of laser optogalvanic spectroscopy as a probe of alkali atoms in an MHD environment, 20:10201 (R;US)
Diagnostic development and support of MHD test facilities. Final progress report, March 1980–March 1994, 20:10772 (R;US)

Mollerus Engineering Corp., Los Gatos, CA (United States)
An assessment of KW Basin radionuclide activity when opening SNF canisters, 20:9770 (R;US)

Montpellier-2 Univ., 34 (France)
Corrosion mechanisms of containment glasses for fission products, 20:9415 (R;FR;In French)

Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki
Diagnostics of hardening coatings based on CrN_x by proton nuclear backscattering, 20:11710 (IA;RU;In Russian)
Use of the proton nuclear backscattering technique for investigation of nitration and oxidation process dynamics in structural steel nitrogenized layers, 20:11709 (IA;RU;In Russian)

MSE, Inc., Butte, MT (United States)
Projects at the Western Environmental Technology Office. Quarterly technical progress report, October 1–December 31, 1994, 20:10861 (R;US)

Muenster Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet
Phase transformations in lithium bearing sodiumborosilicate base glass melts for the solidification of HAW, 20:10409 (R;DE;In German)

N

National Academy of Sciences, Washington, DC (United States)
Government-University-Industry-Research Roundtable, 20:10174 (R;US)
Government-University-Industry-Research Roundtable. Annual report, June 14, 1991–June 14, 1992, 20:10160 (R;US)

SKB annual report 1993. Including summaries of technical reports issued during 1993, 20:9479 (R;SE)
Swedish Nuclear Power Inspectorate, Stockholm (Sweden)
Safety and radiation protection at the swedish nuclear power plants 1993-94, 20:9954 (R;SE;In Swedish)
Swedish Radiation Protection Inst., Stockholm (Sweden)
Monitoring of radionuclides in the terrestrial and aquatic environment of the nuclear power plant at Barsebaeck (Sweden) for the period 1984-1991., 20:10045 (R;SE;In Swedish)
Project Radiation Protection - East, 20:11903 (R;SE;In Swedish)
Radioactive waste disposal - Time aspects., 20:9481 (R;SE;In Swedish)
Safety and radiation protection at the swedish nuclear power plants 1993-94, 20:9954 (R;SE;In Swedish)
The content and environmental impact from the waste depository in Sillamaee, 20:9480 (R;SE)
Swedish Transport and Communications Research Board, Stockholm (Sweden)
Chemical and biological characterization of exhaust emissions from two bioethanol fuels containing different diesel ignition improvers, 20:10290 (R;SE)
Swedish Univ. of Agricultural Sciences, Lund (Sweden). Dept. of Farm Buildings
Combustion of reed canary grass and grains in small furnaces, 20:9844 (R;SE;In Swedish)
Investigation of a straw combustion system for chopped straw, 20:9845 (R;SE;In Swedish)
Straw furnaces on farm level, 20:9846 (R;SE;In Swedish)
Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Microbiology
Adaption of denitrification bacteria to the external coal sources acetate and methanol in an activated sludge process, 20:10948 (R;SE;In Swedish)
Anaerobic decomposition of halogenated compounds with graft from anaerobically treated household wastes, 20:10909 (R;SE;In Swedish)
Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology
Radioactive fission and activation products: Transport from soil to plant under swedish field conditions, 20:10910 (R;SE)
Sorption behaviour of radiocaesium in soils from various regions of Libya and Sweden, 20:10911 (R;SE)
Transfer of 137 Cs to milk of cow and muscle of roe deer. Investigations of dairy farms and forest areas in Central Sweden after the Chernobyl accident, 20:10912 (R;SE)

T

Tampa Electric Co., FL (United States)
Polk power station syngas cooling system, 20:9928 (R;US)
Tampa Electric Company Polk Power Station IGCC Project, 20:9930 (R;US)
TCS, Inc., Oakland, MD (United States)
Micronized coal-fired retrofit system for SO_x reduction: Krakow Clean Fossil Fuels and Energy Efficiency Program. Technical progress report No. 1, [April–June 1994], 20:9943 (R;US)
Micronized coal-fired retrofit system for SO_x reduction: Krakow clean fossil fuels and energy efficiency program. Technical progress report number 2, 20:9246 (R;US)
Technical Research Centre of Finland, Espoo (Finland)
Determination of natural uranium series isotope ratios by mass spectrometry, 20:10466 (R;FI;In Finnish)
Environmental impact of building materials, 20:10235 (R;FI)
Technische Hochschule Aachen (Germany)
Changes in the organic matter in the weathered zone above a petroleum bedrock, 20:9274 (R;DE;In German)
Corrosion behaviour of coat-mix-SiC-filter under simulated conditions of soot filtration, 20:10285 (R;DE;In German)

Crack growth in the pm nickel-base superalloy N18 in the temperature range between 400 and 750 C under static and cyclic loading, 20:10329 (R;DE;In German)
Experimental investigations of graphite corrosion and aerosol formation during air ingress into the core of a high temperature pebble bed reactor, 20:10090 (R;DE;In German)
Inelastic analysis of the deformation behaviour of internally cooled IN 738 LC turbine blades using the microstructural dependent constitutive equations, 20:10328 (R;DE;In German)
Investigations of adsorption and desorption ob mercury and mercury(II)chloride on rhenish lignite coke, 20:10829 (R;DE;In German)

Technische Univ. Berlin (Germany). Fachbereich 6 - Physikalische und Angewandte Chemie
Calculation of the phase difference speed of water and steam in channels with different geometric borders/edges, 20:10544 (R;DE;In German)

Technische Univ. Braunschweig (Germany). Inst. fuer Betriebssysteme und Rechnerverbund
Expert systems help sewage treatment plant operating staff, 20:10270 (R;DE;In German)

Technische Univ. Braunschweig (Germany). Inst. fuer Siedlungswasserwirtschaft
Expert systems help sewage treatment plant operating staff, 20:10270 (R;DE;In German)

Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany). Inst. fuer Maschinenwesen
Studies on the generation and reduction of noise from compressed air rotating piston engines under the aspect of energy transformation. Final report, 20:11232 (R;DE;In German)

Technische Univ. Hamburg-Harburg, Hamburg (Germany). Promotionsausschuss
Combined process of gas permeation and condensation for separation and recovery of organic vapours from off-gas streams, 20:10481 (R;DE;In German)

Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie
Chemical behaviour of trivalent and pentavalent americium in saline NaCl-solutions. Studies of transferability of laboratory data to natural conditions. Interim report. Reported period: 1.2.1993-31.12.1993, 20:10501 (R;DE;In German)
Chemical reactions of actinides with groundwater colloids. Studies of transferability of laboratory data to natural conditions. The aquiferous system in Gorleben. Interim report. Reported period: 1.2.1993-31.12.1993, 20:10500 (R;DE;In German)

TECO Power Services, Tampa, FL (United States)
Tampa Electric Company's Polk Power Station Integrated Gasification Combined Cycle Project, 20:9929 (R;US)

TECOGEN, Inc., Waltham, MA (United States)
Advanced technologies - engineering and design. Technical progress report No. 1, July 1994–September 1994, 20:9938 (R;PL)

Texas A and M Univ., College Station, TX (United States). Dept. of Chemistry
A study of catalysts and mechanisms in synthesis reactions. Progress report, January 1994–December 1994, 20:9309 (R;US)

Texas Univ., Austin, TX (United States)
Nonlinear instability and chaos in plasma wave-wave interactions, I., Introduction, 20:11786 (R;US)

Texas Univ., Austin, TX (United States). Center for Electromechanics
The railplug: A new ignitor for internal combustion engines, 20:10283 (R;US)

Texas Univ., Austin, TX (United States). Center for Nuclear Studies
NEPTUNE. Bound State Wave Functions in Nuclei, 20:11919 (CM;US)

Texas Univ., Austin, TX (United States). Center for Particle Physics
Signatures of Higgs-Triplet representations at TeV-e^+e^- colliders, 20:11394 (R;US)

Texas Univ., Austin, TX (United States). Inst. for Fusion Studies
Magnetic viscosity by localized shear flow instability in magnetized accretion disks, 20:11264 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
Ξ^--hypernuclear states in heavy nuclei, 20:11624 (R;JP)
New algorithm for Hartree-Fock variational equation, 20:11479 (R;JP)
Proceeding of the symposium on the science of short-lived RI beam 1993, 20:11406 (R;JP;In Japanese, English)

Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.
Report on 'basic science on treatment and disposal of radioactive waste (4)' of Yayoi Research Group, 20:9495 (R;JP;In Japanese)

Trafikministeriet, Copenhagen (Denmark)
Environmental stresses caused by the transportation sector, 20:10835 (R;DK;In Danish)

TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States)
FY 93 thermal loading systems study final report: Volume 1. Revision 1, 20:9389 (R;US)
FY 93 thermal loading systems study final report: Volume 2. Revision 1, 20:9390 (R;US)

TRW, Inc., Fairfax, VA (United States)
Yucca Mountain Site Characterization Project technical data catalog: Quarterly supplement, 20:9697 (R;US)

Tulane Univ., New Orleans, LA (United States)
Hazardous materials in aquatic environments of the Mississippi River Basin. Quarterly project status report, October 1, 1994–December 31, 1994, 20:10935 (R;US)

Tulsa Univ., OK (United States)
Volatiles combustion in fluidized beds. Technical progress report, September 4, 1994–December 3, 1994, 20:9262 (R;US)

Tulsa Univ., OK (United States). Dept. of Petroleum Engineering
Reservoir characterization of Pennsylvanian sandstone reservoirs. Final report, 20:9278 (R;US)

U

Umweltbundesamt, Berlin (Germany)
Umweltbundesamt. Annual report 1993, 20:10146 (I;DE;In German)

Underground Injection Practices Council Research Foundation, Oklahoma City, OK (United States)
Assistance to the states with risk based data management. Quarterly technical progress report, May 20, 1994–September 30, 1994, 20:9303 (R;US)

United Technologies Corp., East Hartford, CT (United States). Research Center
Coal-fired high performance power generating system. Quarterly progress report, April 1, 1994–June 30, 1994, 20:9936 (R;US)

Universidade Federal, Rio de Janeiro, RJ (Brazil). Inst. de Geociencias
The environment and the hydroelectric in Amazonia, 20:9856 (I;BR;In Portuguese)

University of North Texas, Denton, TX (United States). Inst. of Petroleum Accounting
An evaluation of accounting-based finding costs as efficiency measures for oil and gas exploration, 20:9273 (R;US)

US Council for Energy Awareness, Washington, DC (United States)
Advanced design nuclear power plants: Competitive, economical electricity. An analysis of the cost of electricity from coal, gas and nuclear power plants, 20:9996 (R;US)
U.S. Council for Energy Awareness 1992-1993, 20:10181 (R;US)

USDOE Albuquerque Operations Office, NM (United States). Uranium Mill Tailings Remedial Action Project Office
Environmental assessment of remedial action at the Slick Rock uranium mill tailings sites Slick Rock, Colorado. Draft, 20:9724 (R;US)

USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of Reconfiguration
Draft programmatic environmental impact statement for tritium supply and recyling. Executive summary, 20:10136 (R;US)
Draft programmatic environmental impact statement for tritium supply and recycling, 20:10792 (R;US)
Draft programmatic environmental impact statement for tritium supply and recycling, 20:10793 (R;US)

Implementation plan: Tritium supply and recycling programmatic environmental impact statement. Revised, 20:10038 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States)

Reporting continuous releases of hazardous and extremely hazardous substances under CERCLA and EPCRA, 20:10135 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Chemical Safety Vulnerability Working Group

Chemical Safety Vulnerability Working Group report. Volume 1, 20:10130 (R;US)

Chemical Safety Vulnerability Working Group report. Volume 2, 20:10131 (R;US)

Chemical Safety Vulnerability Working Group report. Volume 3, 20:10132 (R;US)

Management response plan for the Chemical Safety Vulnerability Working Group report. Volume 1, 20:10133 (R;US)

Management response plan for the Chemical Safety Vulnerability Working Group report. Volume 2, 20:10134 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance

New Land disposal restrictions for contaminated soil and debris, and newly identified toxicity characteristic organic wastes, 20:10127 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div.

Environmental Guidance regulatory bulletin, 20:10128 (R;US)

USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development

Oakland Operations Office, Oakland, California: Technology summary, 20:9728 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States)

Environmental assessment for hazardous materials testing at the Liquified Gaseous Fuels Spill Test Facility, 20:9316 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Fuels Programs

Natural gas: Imports and exports. Third quarter report 1994, 20:9313 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Strategic Petroleum Reserve

Strategic Petroleum Reserve. Quarterly report, 20:9306 (R;US)

USDOE Bartlesville Project Office, OK (United States)

Annex III-evaluation of past and ongoing enhanced oil recovery projects, 20:9276 (R;US)

Economic evaluation of closure cap barrier materials study, 20:9681 (R;US)

USDOE Bonneville Power Administration, Portland, OR (United States)

Burlington Bottoms Wildlife Mitigation Project. Final environmental assessment/management plan and finding of no significant impact, 20:9855 (R;US)

USDOE Carlsbad Area Office, NM (United States)

National Transuranic Program Charter, 20:9386 (R;US)

National transuranic program plan, 20:9385 (R;US)

USDOE Energy Information Administration, Washington, DC (United States)

Decommissioning of U.S. uranium production facilities, 20:9366 (R;US)

USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels

Financial statistics of major US publicly owned electric utilities 1993, 20:10188 (R;US)

USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use

Short-term energy outlook. Quarterly projections, first quarter 1995, 20:10182 (R;US)

USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting

Supplement to the annual energy outlook 1995, 20:10115 (R;US)

USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas

Natural gas annual 1993 supplement: Company profiles, 20:9311 (R;US)

Petroleum marketing monthly, February 1995 - with data for November 1994, 20:9298 (R;US)

Petroleum supply monthly, January 1995, with data for November 1994, 20:9297 (R;US)

Winter fuels report, 20:9299 (R;US)

Winter fuels report, 20:9312 (R;US)

Winter fuels report, 20:9300 (R;US)

Winter fuels report. Week ending: February 10, 1995, 20:10196 (R;US)

USDOE Fernald Field Office, OH (United States)

Final record of decision for remedial actions at Operable Unit 4, 20:9726 (R;US)

USDOE Morgantown Energy Technology Center, WV (United States)

Advanced turbine systems program conceptual design and product development. Quarterly report, May–July 1994, 20:9932 (R;US)

Intermediate-sized natural gas fueled carbonate fuel cell power plants, 20:10206 (R;US)

Intermediate-sized natural gas fueled carbonate fuel cell power plants, 20:10207 (R;US)

PIMM: A Performance Improvement Measurement Methodology, 20:9268 (R;US)

Proceedings of Opportunity '95 – Environmental technology through small business, 20:9384 (R;US)

Small-scale AFBC-hot air gas turbine power cycle, 20:9935 (R;US)

USDOE Nevada Operations Office, Las Vegas, NV (United States)

Resource Conservation and Recovery Act Industrial Sites quality assurance project plan: Nevada Test Site, Nevada, 20:10862 (R;US)

USDOE Nevada Operations Office, Las Vegas, NV (United States). Office of External Affairs

United States nuclear tests, July 1945 through September 1992, 20:10794 (R;US)

USDOE Office of Energy Research, Washington, DC (United States)

Program solicitation. Closing date: March 1, 1995, 20:10158 (R;US)

Science for a sustainable future, 20:10156 (R;US)

Small Business Innovation Research: Abstracts of Phase 1 awards, 1994, 20:10159 (R;US)

USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States)

Stewards of a national resource, 20:10161 (R;US)

USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development

Albuquerque Operations Office, Albuquerque, New Mexico: Technology summary, 20:9727 (R;US)

USDOE Office of Nonproliferation and National Security, Washington, DC (United States)

Comprehensive Test Ban Treaty research and development FY95-96 program plan, 20:10292 (R;US)

USDOE Office of Public and Consumer Affairs, Washington, DC (United States)

The Energy Messenger, Number 1, Volume 4, 20:10155 (R;US)

USDOE Office of Science Education and Technical Information, Washington, DC (United States). Office of Science Education Programs

Energy-related laboratory equipment (ERLE) guidelines, 20:11883 (R;US)

USDOE Pittsburgh Energy Technology Center, PA (United States)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 1, 1993–November 30, 1993, 20:9256 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, December 1, 1993–February 28, 1994, 20:9257 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, March 6, 1991–June 5, 1991, 20:9249 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, June 6, 1991–September 5, 1991, 20:9250 (R;US)
Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 6, 1991–December 5, 1991, 20:9251 (R;US)
Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 6, 1992–December 5, 1992, 20:9252 (R;US)

USDOE Richland Operations Office, WA (United States)
RCRA Facility investigation/corrective measures study work plan for the 100-DR-2 operable unit, Hanford Site, Richland, Washington, 20:9729 (R;US)

USDOE Savannah River Operations Office, Aiken, SC (United States)
Draft Environmental Impact Statement, Waste Management, Savannah River Site, Aiken, South Carolina, 20:9380 (R;US)
Environmental assessment for the offsite commercial cleaning of controlled and routine laundry from the Savannah River Site, 20:9725 (R;US)
Savannah River Site Waste Management Draft Environmental Impact Statement, 20:9381 (R;US)

USDOE, Washington, DC (United States)
Airborne release fractions/rates and respirable fractions for nonreactor nuclear facilities. Volume 1, Analysis of experimental data, 20:9693 (R;US)
Airborne release fractions/rates and respirable fractions for nonreactor nuclear facilities. Volume 2, Appendices, 20:9694 (R;US)
EM Health and Safety Plan Guidelines, 20:11070 (R;US)
Requesting and granting exemptions to nuclear safety rules, 20:9730 (R;US)
Sector-specific issues and reporting methodologies supporting the General Guidelines for the voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992. Volume 1: Part 1, Electricity supply sector; Part 2, Residential and commercial buildings sector; Part 3, Industrial sector, 20:10139 (R;US)
Sector-specific issues and reporting methodologies supporting the General Guidelines for the voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992. Volume 2: Part 4, Transportation sector; Part 5, Forestry sector; Part 6, Agricultural sector, 20:10140 (R;US)
Voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992: General Guidelines, 20:10138 (R;US)

Ustav Jaderneho Vyzkumu a.s., Rez (Czech Republic)
Annual report 1991, 20:11892 (I;CZ)
Annual report 1992, 20:11893 (I;CZ)

Utah State Univ., Logan, UT (United States). Dept. of Mathematics and Statistics
Newton iterative methods for large scale nonlinear systems. Final report, August 1992–July 1994, 20:11908 (R;US)

Utah Univ., Salt Lake City, UT (United States). Dept. of Metallurgy and Metallurgical Engineering
New concept for coal wettability evaluation and modulation. Technical progress report, October 1, 1994–December 31, 1994, 20:9270 (R;US)

V

Vattenfall Utveckling AB, Vaellingby (Sweden)
Consequences for invertebrates of the use of forest fuel, 20:9850 (R;SE;In Swedish)
VEGA test and verification - Pressurized gasification of biomass, 20:9840 (R;SE;In Swedish)

VEBA AG, Duesseldorf (Germany)
The VEBA group 1994/'95. Data of October 1994, 20:11881 (I;DE;In German)

Vermont Univ., Burlington, VT (United States). Research Center for Groundwater Remediation Design
MODLP program description: A program for solving linear optimal hydraulic control of groundwater contamination based on MODFLOW simulation. Version 1.0, 20:10914 (R;US)

Vienna Univ. (Austria). Inst. fuer Theoretische Physik
Clustering for algebraic K-systems, 20:11253 (R;AT)
Strong clustering in type III entropic K-systems, 20:11254 (R;AT)

W

Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory
Magnetization of ferromagnetic clusters, 20:11263 (R;US)
The gluon propagator in non-Abelian Weizsaecker-Williams fields, 20:11321 (R;US)

Wastren, Inc., Idaho Falls, ID (United States)
Safety basis for the 241-AN-107 mixer pump installation and caustic addition, 20:9610 (R;US)

West Virginia Univ. Research Corp., Morgantown, WV (United States)
Disposal of fluidized-bed combustion ash in an underground mine to control acid mine drainage and subsidence. Quarterly report, May–August 1994, 20:9222 (R;US)
Waste Management Education and Research Consortium (WERC), National Environmental Design. Topical report, 20:10137 (R;US)

Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.
FY95 capital asset implementation plan, 20:9392 (R;US)
No-migration determination. Annual report, September 1, 1993–August 31, 1994, 20:9391 (R;US)

Westinghouse Electric Corp., Orlando, FL (United States). Power Generation Business Unit
Advanced Turbine Systems Program conceptual design and product development. Annual report, August 1993–July 1994, 20:9934 (R;US)

Westinghouse Electric Corp., West Mifflin, PA (United States). Bettis Atomic Power Lab.
An approximate algorithm for the flux from a rectangular volume source, 20:11699 (R;US)

Westinghouse Hanford Co., Richland, WA (United States)
105-KE Basin isolation barrier leak rate test analytical development, 20:9533 (R;US)
1995 Study and evaluation of fugitive and diffuse emissions from the 200 East Area at the Hanford Site, 20:9713 (R;US)
233-S plutonium concentration facility hazards assessment, 20:9531 (R;US)
241-A evaporator flowsheet users manual, 20:9658 (R;US)
241-TX acoustic monitoring 114TX tank waste, 20:9645 (R;US)
242-A evaporator vacuum condenser system, 20:9621 (R;US)
305 Building cold test facility management plan, 20:9536 (R;US)
384 Power plant waste water sampling and analysis plan, 20:10950 (R;US)
45 Day safety screen results for Tank 241-C-108 – Augers 94-012, 94-014 and 94-015, 20:9593 (R;US)
45-Day safety screen results for single shell tank 241-AP-106, liquid grab samples, riser 1, 30° and 150° in conjunction with evaporator campaign 95-1, 20:9592 (R;US)
A model for determining when an analysis contains sufficient detail to provide adequate NEPA coverage for a proposed action, 20:10185 (R;US)
A summary report on the search for current technologies and developers to develop depth profiling/physical parameter end effectors, 20:9541 (R;US)
Acceptance test procedure for C-018H, 242-A evaporator/PUREX plant process condensate treatment facility, 20:9518 (R;US)
Acceptance test procedure for SY Tank Farm replacement exhauster unit, 20:9585 (R;US)
Acceptance test procedure for the MO-293 (1722) 10-wide mobile office, 20:9769 (R;US)
Acceptance test report for tank bottom thermocouples on Tank 241-SY-101, 20:9587 (R;US)
Acceptance test report for the link belt LS-518 crane hook position/rate indication system, 20:10538 (R;US)
Achievement of process control, safety, and regulatory compliance in a mixed waste evaporator system at the Hanford Site using data quality objectives, 20:9517 (R;US)

Addendum 2 to CSER 79-002: Extension of the 150 gram fissile limit used in room 187 of PFP, 20:9540 (R;US)
Alternative concepts for treatment and disposal of Hanford site high-level waste in tanks, 20:9626 (R;US)
Alternatives for the disposition of fuel stored in the PUREX facility, 20:9349 (R;US)
An assessment of KW Basin radionuclide activity when opening SNF canisters, 20:9770 (R;US)
An ugly duckling becomes a swan ···: How an organization becomes customer focused through listening, 20:11951 (R;US)
ANACAP-U software configuration and installation verification on the SECC, 20:10532 (R;US)
Analyses and characterization of double shell tank, 20:9590 (R;US)
Analysis and characterization of double shell tank 241-AP-108, 20:9589 (R;US)
Analysis of K-1 fan system for replacement of valve actuator, B Plant/Waste Encapsulation and Storage Facility, 20:10537 (R;US)
Analysis of lifting beam and redesigned lifting lugs for 241-AZ-01A decant pump, 20:10263 (R;US)
Analytical services: 222-S characterization of 242-A Evaporator Slurry, Campaign 94-1. Addendum 1A, 20:9591 (R;US)
Application of a CdTe gamma-ray spectrometer to remote characterization of high-level radioactive waste tanks, 20:9506 (R;US)
Aqueous samples from B-Plant, Tank 9-1, 20:10919 (R;US)
Attachments for fire modeling for Building 221-T, T Plant canyon deck and railroad tunnel, 20:9759 (R;US)
B-Plant canyon fire foam supply, 20:10264 (R;US)
B-Plant canyon fire foam supply. Report, 20:9776 (R;US)
BCE selector valves and flow proportional sampler, 20:9544 (R;US)
BCP selector valves and limit switches, 20:10781 (R;US)
Borehole data package for the 100-K area ground water wells, CY 1994, 20:9711 (R;US)
CENRTC Project No. 2F3EOA, OCB A-372, acceptance test procedure, 20:10105 (R;US)
Certification of version 1.2 of the PORFLO-3 code for the WHC scientific and engineering computational center, 20:10918 (R;US)
Compliance matrix for the Mixed Waste Disposal Facilities, Trenches 31 and 34, burial ground 218-W-5. Revision 1, 20:9618 (R;US)
Configuration management plan for LABCORE Program, 20:11958 (R;US)
Configuration management plan for the GENII software, 20:9715 (R;US)
Construction quality assurance report, 20:9547 (R;US)
Corrosion control of the Hanford Site waste transfer system, 20:9514 (R;US)
CPAC optical moisture monitoring: Characterization of composition and physical effects on moisture determination Task 2A report, 20:9598 (R;US)
Criticality classification of waste receiving and processing module 2A, 20:9554 (R;US)
CSER 94-011: Use of glovebags for demister draining operations, 20:10531 (R;US)
CSER 94-013: Classification and access to PFP 232-Z Incinerator Facility and limits on characterization and disassembly activities in 232-Z burning hood, 20:9539 (R;US)
CSER 94-015: New portable NDA equipment for use in SNM audits, 20:10758 (R;US)
Description of the solid waste container corrosion program at the Hanford Site, 20:9516 (R;US)
Descriptions and diagrams of the primary and annulus ventilation systems of the double-shell tank farms as of January 1988, 20:9628 (R;US)
Design criteria document, electrical system, K-Basin essential systems recovery, Project W-405, 20:10530 (R;US)
Design criteria document, Fire Protection Task, K Basin Essential Systems Recovery, Project W-405, 20:9363 (R;US)
Design criteria document, Maintenance Shop/Support Facility, K-Basin Essential Systems Recovery, Project W-405, 20:9350 (R;US)
Design criteria tank farm storage and staging facility, 20:9579 (R;US)
Design review plan for Multi-Function Waste Tank Facility (Project W-236A), 20:9562 (R;US)
Documentation and analysis for packaging limited quantity ice chests, 20:10534 (R;US)
Documentation assessment, Project C-018H, 200-E area effluent treatment facility, 20:9526 (R;US)
Dome load control and crane land path evaluation for Tank 241-SY-101 during hydrogen mitigation pump removal and installation, 20:9596 (R;US)
DOT-7A packaging test procedure, 20:9361 (R;US)
DOT-7A Type A packaging design guide, 20:9360 (R;US)
Double shell tank waste analysis plan, 20:9605 (R;US)
Effectiveness of an effluent retention pond cover to reduce atmospheric source terms, 20:9512 (R;US)
Engineering Phase 2 and Phase 3 certification programs – PUREX deactivation, 20:9762 (R;US)
Engineering task plan and status of 241-S-106 Enraf level gauge wire break, 20:9600 (R;US)
Engineering task plan for Enraf Nonius densitometer assembly design, 20:9601 (R;US)
Engineering task plan for flammable gas atmosphere mobile color video camera systems, 20:9602 (R;US)
Engineering task plan for the vapor monitor installation into 241-C-103 tank, 20:9599 (R;US)
Engineering test plan for Tank 241-SY-101 in situ viscometer, 20:9640 (R;US)
Engineering work plan for design requirements document, Project W-058/028, 20:9552 (R;US)
Engineering work plan for implementing the Process Condensate Recycle Project at the 242-A evaporator, 20:9662 (R;US)
Engineering work plan for tank 241-C-103 vapor phase characterization (ECN 613188). Revision 1, 20:9779 (R;US)
Enraf Series 854 advanced technology gauge (ATG) acceptance test procedure. Revision 2, 20:9584 (R;US)
Estimates of laboratory accuracy and precision on Hanford waste tank samples, 20:9582 (R;US)
Evaluating airborne radionuclide concentrations in the tank farms, 20:9717 (R;US)
Facility effluent monitoring plan for the plutonium uranium extraction facility, 20:9496 (R;US)
Fast Flux Test Facility, Sodium Storage Facility project-specific project management plan, 20:9527 (R;US)
Fire alarm system, 20:10529 (R;US)
Fire hazards analysis and safety analysis report requirements, 20:9766 (R;US)
Fire hazards analysis for the uranium oxide (UO_3) facility, 20:9793 (R;US)
Fire hazards analysis for W-413, West Area Tank Farm Storage and Staging Facility, 20:9581 (R;US)
Fire hazards analysis, east tank farm storage and staging facility, 20:9580 (R;US)
Fire modeling for Building 221-T - T Plant Canyon Deck and Railroad Tunnel, 20:9519 (R;US)
Fiscal year 1995 work scope for the 222-S, WSCF, 325, and Litco Laboratories, 20:9616 (R;US)
Functions and requirements for 105-KE Basin sludge retrieval and packaging, 20:9534 (R;US)
Functions and requirements for K Basin SNF characterization shipping, 20:9352 (R;US)
Functions and requirements for tank farm restoration and safe operations, Project W-314. Revision 3, 20:9576 (R;US)
G3 model of gas and liquid migration from grout containing radioactive waste, 20:9513 (R;US)
Gas and liquid sampling for closed canisters in the K-West Basin, 20:9336 (R;US)
Gas characterization system functional design criteria, 20:9608 (R;US)
Gas liquid sampling for closed canisters in KW Basin - test plan, 20:9538 (R;US)
General Counsel's office FY 1995 site support program plan WBS 6.10.5, 20:9664 (R;US)
Generation and release of flammable gases in Hanford tanks: An overview, 20:9510 (R;US)

Geophysical investigation for proposed flow meter installation holes, 100H Area, 20:10917 (R;US)
Geophysical investigation of the SQ Tanks, 221-T Building, 200 West Area, 20:9524 (R;US)
Geophysical survey for proposed boreholes, 199-K-109A, 199-K-110A, and 199-K-111A, 100K Area, 20:9712 (R;US)
Geophysical surveys for proposed boreholes 299-W15-25, 26 and 27, 200 West Area, 20:9525 (R;US)
Groundwater maps of the Hanford Site, June 1994, 20:9709 (R;US)
Guide for preparing and maintaining generator group pollution prevention program documentation. Revision 2, 20:9604 (R;US)
Hanford double shell tank corrosion monitoring instrument trees, 20:9509 (R;US)
Hanford Patrol Academy demolition sites closure plan, 20:9388 (R;US)
Hanford Site existing irradiated fuel storage facilities description, 20:9358 (R;US)
Hanford spent nuclear fuel project recommended path forward, volume III: Alternatives and path forward evaluation supporting documentation, 20:9347 (R;US)
Hazard categorization of 100 K West fuel canister gas and liquid sampling, 20:9354 (R;US)
Hazard categorization of 100K east and 100K west in-basin fuel characterization program activities, 20:9535 (R;US)
Hazard control indices for radiological and non-radiological materials, 20:9575 (R;US)
HC-21C off-gas test procedure, 20:9521 (R;US)
Heat exchanger bypass test report, 20:9523 (R;US)
High level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 6, 20:9502 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 1, 20:9497 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 2, 20:9498 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), 20:9499 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 4, 20:9500 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 5, 20:9501 (R;US)
High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 7. Revision 1, 20:9503 (R;US)
Hydrogen recombiner catalyst test supporting data, 20:9656 (R;US)
In situ characterization of metal fuel stored in the Hanford K Basins, 20:9348 (R;US)
In situ sampling cart development engineering task plan, 20:9603 (R;US)
Independent assessment to continue improvement: Implementing statistical process control at the Hanford Site, 20:9335 (R;US)
Integrated dynamic modeling and management system mission analysis, 20:9611 (R;US)
Interface control document between Analytical Services and Solid Waste Disposal Division, 20:9614 (R;US)
Interface control document between PFP Transition Project and Solid Waste Disposal Division, 20:9615 (R;US)
Interim safety basis compliance matrix for Trenches 31 and 34, 20:9774 (R;US)
IX Disposition Project - project management plan, 20:9537 (R;US)
K Basin safety analysis, 20:9771 (R;US)
K Basins fuel encapsulation and storage hazard categorization, 20:9353 (R;US)
Kaiser Engineers Hanford internal position paper – Project W-236A, Multi-function Waste Tank Facility – Peer reviews of selected activities, 20:9564 (R;US)
KE Basin monorail modification for the sludge removal and packaging project, 20:9351 (R;US)
LDUA engineering development plan, 20:10533 (R;US)
Lessons learned during the development and conduct of exercise Fermont, 20:9758 (R;US)
Level maintenance for Tank 101-SY mitigation-by-mixing test, 20:9654 (R;US)
Life-cycle cost analysis 200-West Weather Enclosure: Multi-function Waste Tank Facility, 20:9560 (R;US)
Liquid Effluent Monitoring Information System test plans release 1.2, 20:9635 (R;US)
Liquid Observation Well (LOW) Functional Design, 20:9609 (R;US)
LLBG mixed waste disposal facility leachate sampling and analysis plan, 20:9606 (R;US)
Loss/gain on ignition testing for HC-21C, 20:9522 (R;US)
Management plan – Multi-Function Waste Tank Facility. Revision 1, 20:9561 (R;US)
Material selection for Multi-Function Waste Tank Facility tanks, 20:9508 (R;US)
Mitigation of hydrogen by oxidation using nitrous oxide and noble metal catalysts, 20:9655 (R;US)
Mixed waste trench loading placement instructions, 20:9583 (R;US)
Number of core samples: Mean concentrations and confidence intervals, 20:9633 (R;US)
Operational test procedure for Bldg 241-A-701 air compressor, 20:9612 (R;US)
OSR encapsulation basis – 100-KW, 20:9357 (R;US)
Packaging design criteria, transfer and disposal of 102-AP mixer pump, 20:9543 (R;US)
Permitting plan for project W-236B, initial pretreatment module, 20:9573 (R;US)
PFP MICON view user manual, 20:11952 (R;US)
Photos of deficiencies found during roof inspection, 20:9765 (R;US)
Pig shipping container test sequence, 20:10536 (R;US)
Plutonium finishing plant safeguards and security systems replacement study, 20:9791 (R;US)
Plutonium finishing plant safety systems and equipment list, 20:9329 (R;US)
Position paper - peer review and design verification of selected activities, 20:9571 (R;US)
Position paper - primary ventilation system configuration, 20:9567 (R;US)
Position paper - tank inlet air temperatures, 20:9565 (R;US)
Position paper – Continuous air monitor (CAM) acquisition recommendation, 20:9570 (R;US)
Position paper – Tank heat loading. Revision 1, 20:9568 (R;US)
Position paper – Tank temperature element location, 20:9569 (R;US)
Position paper – Tank ventilation system design air flow rates, 20:9566 (R;US)
Precipitation of plutonium from acidic solutions using magnesium oxide, 20:10467 (R;US)
Preliminary flowsheet: Ion exchange for separation of cesium from Hanford tank waste using resorcinol-formaldehyde resin, 20:9778 (R;US)
Preliminiary flowsheet: Ion exchange process for the separation of cesium from Hanford tank waste using Duolite™ CS-100 resin, 20:9632 (R;US)
Project 93L-EWL-097, fire alarm system improvements, 300 Area, 20:9767 (R;US)
Project management plan for Contract Management Information System (CONTRACT), 20:11904 (R;US)
Project management plan for Project 93L-EWW-087, "222-S radioactive liquid waste line replacement", 20:9553 (R;US)
Project management plan for Project W-178, 219-S secondary containment, 20:9558 (R;US)
Project quality assurance plant: Sodium storage facility, project F-031, 20:9528 (R;US)
Project W-049H disposal facility test report, 20:9550 (R;US)
Project W-049H instrument & control acceptance test report, 20:9551 (R;US)
Project W-151 development work plan for: Tank AZ-101 riser mapping tool and data acquisition system, 20:9557 (R;US)
Project W-236A, work plan for preparation of a design requirements document, 20:9572 (R;US)
PRTR/309 building nuclear facility preliminary, 20:10103 (R;US)

PUREX Deactivation Health and Safety documentation, 20:9760 (R;US)
Purex plant safety equipment list for deactivation. Revision 2, 20:9768 (R;US)
PWR Core II blanket fuel disposition recommendation of storage option study, 20:9364 (R;US)
Qualification test for the flexible receiver. Revision 2, 20:9578 (R;US)
Qualitative risk assessment for the 100-HR-3 groundwater operable unit, 20:9763 (R;US)
Quarterly report of RCRA groundwater monitoring data for period July 1 through September 30, 1994, 20:9696 (R;US)
Recommendation on changing interfaces of W-058 and W-236A, 20:9563 (R;US)
Release of HWVP design media, 20:9530 (R;US)
Results from evaporation tests to support the MWTF heat removal system design, 20:9559 (R;US)
Results of gas monitoring of double-shell flammable gas watch list tanks, 20:9634 (R;US)
Retrieval of underground storage tank wastes: The Hanford challenge, 20:9507 (R;US)
Safety analysis for push-mode and rotary-mode core sampling, 20:9777 (R;US)
Safety assessment of discharge chute isolation barrier preparation and installation, 20:9355 (R;US)
Safety assessment of discharge chute isolation barrier preparation and installation activities. Revision 3, 20:9772 (R;US)
Safety basis for the 241-AN-107 mixer pump installation and caustic addition, 20:9610 (R;US)
Safety evaluation – Spent water treatment system components inventory release, 20:9773 (R;US)
Safety evaluation for adding water to tank 101-SY, 20:9620 (R;US)
Safety Evaluation for Packaging 101-SY Hydrogen Mitigation Mixer Pump package, 20:10535 (R;US)
Safety Evaluation for Packaging for the N Reactor/single pass reactor fuel characterization shipments, 20:9362 (R;US)
Safety evaluation of interim stabilization of non-stabilized single-shell watch list tanks, 20:9629 (R;US)
Seismic analysis of safety class 1 incinerator glovebox in building 232-Z 200 W Area, 20:9761 (R;US)
Selection of ENRAF gauge wire material compatible with the Hanford waste tank environment, 20:9619 (R;US)
Software design description and configuration management plan for Acromag calibration system, 20:10760 (R;US)
Soil load above Hanford waste storage tanks (2 volumes), 20:9631 (R;US)
Spare mitigation/retrieval mixer pumps, 20:9607 (R;US)
Special case waste hazard categorization. Revision 1, 20:9775 (R;US)
Spent nuclear fuel sampling strategy, 20:9356 (R;US)
Spent nuclear fuels project characterization data quality objectives strategy, 20:9346 (R;US)
Standard-B Hydrogen Monitoring System, system design description, 20:9624 (R;US)
State of work for services provided by the Waste Sampling and Characterization Facility for effluent monitoring, 20:9710 (R;US)
Statistical characterization report for Single-Shell Tank 241-T-104, 20:9630 (R;US)
Status of outdoor radioactive contamination at the Hanford Site, 20:9718 (R;US)
Structural analysis of the equipment removal system for tanks 241C106 and 241AY102, 20:9577 (R;US)
Subsurface barrier feasibility evaluation: External review meeting report, 20:9504 (R;US)
Supplemental design requirements document enhanced radioactive and mixed waste storage Phase V Project W-112, 20:9555 (R;US)
Supplemental design requirements document solid waste operations complex, 20:9574 (R;US)
Supplmental design requirements document enhanced radioactive and mixed waste storage: Phase 5, Project W-113, 20:9556 (R;US)
SY101 in situ viscometer instrument system design description, 20:9622 (R;US)
System design description for Waste Information and Control System, 20:9623 (R;US)
Systems engineering implementation plan for the liquid effluents services program, 20:9617 (R;US)
T Plant removal of PWR Chiller Subsystem, 20:9365 (R;US)
T-Farm complex alarm upgrades, 20:9588 (R;US)
Tank 241-AP-107 tank characterization plan. Revision 1, 20:9647 (R;US)
Tank 241-AX-102 tank characterization plan, 20:9641 (R;US)
Tank 241-B-103 tank characterization plan, 20:9642 (R;US)
Tank 241-B-112 tank characterization plan, 20:9653 (R;US)
Tank 241-BX-104 tank characterization plan, 20:9652 (R;US)
Tank 241-BY-105 tank characterization plan, 20:9639 (R;US)
Tank 241-BY-106 tank characterization plan, 20:9638 (R;US)
Tank 241-C-101 tank characterization plan, 20:9646 (R;US)
Tank 241-C-103 tank characterization plan. Revision 1, 20:9637 (R;US)
Tank 241-C-107 tank characterization plan, 20:9649 (R;US)
Tank 241-C-111 headspace gas and vapor sample results - August 1993 samples, 20:9643 (R;US)
Tank 241-T-107 tank characterization plan, 20:9651 (R;US)
Tank 241-T-111 tank characterization plan, 20:9636 (R;US)
Tank 241-U-103 tank characterization plan, 20:9648 (R;US)
Tank characterization report for double-shell tank 241-AP-105, 20:9595 (R;US)
Tank farms essential and support drawing plan. Revision 6, 20:9613 (R;US)
TBP and diluent mass balances in the PUREX Plant at Hanford, 1955–1991, 20:9505 (R;US)
Technical assessment of TRUSAF for compliance with work place air sampling. Revision 1, 20:9714 (R;US)
Technical description of stack 296-B-10, 20:9716 (R;US)
Telepresence and virtual environment applications on the light duty utility arm system, 20:9515 (R;US)
Test documentation for the GENII Software Version 1.485, 20:11222 (R;US)
Test plan for evaluation of plasma melter technology for vitrification of high-sodium content low-level radioactive liquid wastes, 20:9659 (R;US)
Test plan for K-Basin fuel handling tools, 20:9359 (R;US)
Test plan for qualification of the S-type fiberglass materials for use as the liquid observation well casing, 20:9650 (R;US)
Test plan for slow speed core sampling envelope test, 20:9644 (R;US)
Test procedure for boxed waste assay system, 20:9549 (R;US)
Test procedure for use of the shear vane in tanks 103-SY, 103-AN, and 103-AW, 20:9627 (R;US)
Test report for run-in acceptance testing of hydrogen mitigation test pump-2, 20:9529 (R;US)
Test specification for decant pump and winch assembly, 20:10262 (R;US)
Testing and development strategy for the tank waste remediation system, 20:9625 (R;US)
Testing of isolation barrier sealing surfaces, 20:9532 (R;US)
The Fast Flux Test Facility shutdown program plan, 20:10076 (R;US)
The grout/glass performance assessment code system (GPACS) with verification and benchmarking, 20:9657 (R;US)
The solubilities of significant organic compounds in HLW tank supernate solutions, 20:9511 (R;US)
Thermal analysis of tank 241-SY-101 to support structural assessment, 20:9594 (R;US)
Type B investigation of electrical fault in 351 Substation, December 4, 1994, 20:9757 (R;US)
Uncertainties in the measured quantities of water leaving waste Tank 241-C-106 via the ventilation system, 20:9597 (R;US)
UO_3 building hazard classification - deactivated state, 20:9520 (R;US)
UO_3 plant turnover - facility description document, 20:9792 (R;US)
Users manual for the Acromag calibration system, 20:10761 (R;US)
Vendors search for viscosity sensors for in situ tank waste characterization, 20:9542 (R;US)
Verification/acceptance test plan/procedure for Acromag calibration system, 20:10539 (R;US)

Video requirements plan for the HMT equipment removal system, 20:9780 (R;US)
Void fraction instrument software, Version 1.1., acceptance test procedure, 20:9586 (R;US)
W-025, Acceptance Test Report, 20:9545 (R;US)
Westinghouse Hanford Company FY 1995 Materials Management Plan (MMP), 20:9663 (R;US)
Work plan for SY Farm Integrated Data Acquisition and Control System (DACS-2a), 20:9661 (R;US)
Work plan for upgrade of SY-101 Hydrogen Mitigation Test Project Data Acquisition and Control Systemm (DACS-1), 20:9660 (R;US)
WRAP Module 1 waste characterization plan, 20:9548 (R;US)

Westinghouse Savannah River Co., Aiken, SC (United States)
A comparative study of worker and general public risks from nuclear facility operation using MACCS2, 20:10047 (R;US)
A disposition strategy for highly enriched, aluminum-based fuel from research and test reactors, 20:9669 (R;US)
A dynamic simulation model of the Savannah River Site high level waste complex, 20:9674 (R;US)
Anodic oxidation of tetrasodium ethylenediaminetetraacetic acid in alkaine solutions, 20:10265 (R;US)
Applications of Atomistic Simulation to Radioactive and Hazardous Waste Glass Formulation Development, 20:9680 (R;US)
Composition for catalyzing hydrogen isotope exchange, 20:9807 (PA;US)
Corrosion of aluminum-cald spent fuel in reactor basin water storage, 20:9667 (R;US)
Criticality assessment of TRU burial ground culverts, 20:9720 (R;US)
Decontamination Study for Mixed Waste Storage Tanks RCRA Closure, 20:9787 (R;US)
Determination of frequencies of contamination and fire related incidents for DWPF SAR, 20:9786 (R;US)
Determination of uranium distribution in the evaporation of simulated Savannah River Site waste, 20:9678 (R;US)
Development of Plasma Vitrification Technology for Contaminated Soil at the Savannah River Site, 20:9784 (R;US)
Development of the stored waste autonomous mobile inspector (SWAMI II), 20:9676 (R;US)
Dose Contribution from High Level Waste Uranium and Plutonium. Revision 1, 20:11223 (R;US)
Dynamic and quasi-static simulation and analysis of the plutonium oxide/metal containers subject to 30-foot dropping, 20:9672 (R;US)
Economic evaluation of closure CAP barrier materials Volume I and Volume II, 20:9685 (R;US)
Experience with Palladium Diffusers in Tritium Processing, 20:9330 (R;US)
Federal Facility Agreement progress report, 20:9785 (R;US)
H-Area Acid/Caustic Basin groundwater monitoring report. Third quarter 1994, 20:10923 (R;US)
Hot-wall corrosion testing of simulated high level nuclear waste, 20:9666 (R;US)
Hydrogen absorption/desorption method and apparatus, 20:9828 (PA;US)
Hydrogen Evolution and Sludge Suspension During the Preparation of the First Batch of Sludge at the Savannah River Site, 20:9668 (R;US)
In-bed accountability of tritium in production scale metal hydride storage beds, 20:9794 (R;US)
Incineration of Low Level Radioactive Vegetation for Waste Volume Reduction, 20:9783 (R;US)
Initial results from the canistered waste forms produced during the first campaign of the DWPF Startup Test Program, 20:9684 (R;US)
K-Area Acid/Caustic Basin groundwater monitoring report. Second quarter 1994, 20:10920 (R;US)
L-Area Reactor - 1993 annual - groundwater monitoring report, 20:10921 (R;US)
Metallography of pitted aluminum-clad, depleted uranium fuel, 20:9670 (R;US)
Mixed Waste Management Facility groundwater monitoring report: Third quarter 1994, 20:9687 (R;US)
Modeling of batch operations in the Defense Waste Processing Facility at the Savannah River Site, 20:9675 (R;US)
Nitric-phosphoric acid oxidation of solid and liquid organic materials, 20:9677 (R;US)
Nuclear criticality safety analysis summary report: The S-area defense waste processing facility, 20:9682 (R;US)
Plant community development within the F- and H-Area tree-kill zone, 20:11231 (R;US)
Preliminary safety evaluation (PSE) for Sodium Storage Facility at the Fast Flux Test Facility, 20:9764 (R;US)
Process and apparatus for producing tritium, 20:9806 (PA;US)
Quarterly sampling of the wetlands along the old F-Area effluent ditch: March 1994, 20:9721 (R;US)
R-Area Reactor 1993 annual groundwater monitoring report, 20:10922 (R;US)
Radiological consequences of a propagated fire accident in a radiochemical separations facility, 20:9782 (R;US)
Recycle of radiologically contaminated austenitic stainless steels, 20:9673 (R;US)
Results of Macroinvertebrate Sampling Conducted at 33 SRS Stream Locations, July–August 1993, 20:11224 (R;US)
Safety Evaluation of the ESP Sludge Washing Baselines Runs. Revision 1, 20:9686 (R;US)
Seismic evaluation of piping systems using screening criteria, 20:10348 (R;US)
Smart implementation of worker safety emergency preparedness programs at DOE non-nuclear facilities, 20:9781 (R;US)
Subcontracting strategy for the decontamination and decommissioning of Savannah River Site's First Tritium Extraction Facility, 232-F, 20:9689 (R;US)
Successful characterization of radioactive waste at the Savannah River Site, 20:9679 (R;US)
Technetium-99, iodine-129 and tritium in the waters of the Savannah River Site, 20:9719 (R;US)
Tests of Cs-137 removal from DWPF samples prior to analysis, 20:9671 (R;US)
The Savannah River Site's Groundwater Monitoring Program. Second quarter 1994, 20:9411 (R;US)
Thirty-year solid waste generation forecast for facilities at SRS, 20:9683 (R;US)
Titanium for long-term tritium storage, 20:9688 (R;US)
Tritium Processing and Containment Practices at the Savannah River Site, 20:9331 (R;US)
Validation concerns for dry storage of foreign research reactor spent nuclear fuel, 20:9665 (R;US)

Woodward-Clyde Consultants, Oakland, CA (United States)
Evaluation of potential surface rupture and review of current seismic hazards program at the Los Alamos National Laboratory. Final report, 20:10886 (R;US)

Wuppertal Univ. (Gesamthochschule) (Germany). Fachbereich 14 - Sicherheitstechnik
Safety and reliability analysis of a technical system applying the multistate coherent system analysis for evaluating a finite number of normal operating modes and failure modes. Final report, 20:10088 (R;DE;In German)

Wuppertal Univ. (Gesamthochschule) (Germany). Fachbereich 8 - Naturwissenschaften 1 - Physik
Determination of the strong coupling constant $\alpha_s(M_Z^2)$ under regardment of completely resummed leading and next-to-leading logarithms. Analysis of global event variables measured in hadronic Z decays, 20:11335 (R;DE;In German)

Y

Yale Univ., New Haven, CT (United States)
Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 6, 1990–December 5, 1990, 20:9247 (R;US)
Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, December 6, 1990–March 5, 1991, 20:9248 (R;US)

Yale Univ., New Haven, CT (United States). Dept. of Chemical Engineering

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, December 6, 1992–February 28, 1993, 20:9253 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, June 1, 1993–August 31, 1993, 20:9255 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 1, 1993–November 30, 1993, 20:9256 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, December 1, 1993–February 28, 1994, 20:9257 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, March 6, 1991–June 5, 1991, 20:9249 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, June 6, 1991–September 5, 1991, 20:9250 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 6, 1991–December 5, 1991, 20:9251 (R;US)

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, September 6, 1992–December 5, 1992, 20:9252 (R;US)

Yale Univ., New Haven, CT (United States). Dept. of Chemistry

Two dimensional NMR and NMR relaxation studies of coal structure. Progress report, June 30, 1994–September 30, 1994, 20:9217 (R;US)

Yale Univ., New Haven, CT (United States). High Temperature Chemical Reaction Engineering Lab.

Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report No. 11, March 1, 1993–May 31, 1993, 20:9254 (R;US)

Z

Zentrum fuer Sonnenenergie- und Wasserstoff-Forschung (ZSW), Stuttgart (Germany)

Investigations of photovoltaic system performance at the Widderstall photovoltaic test plant. Final report, 20:9858 (R;DE;In German)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.
